Customer Service, Case Management & Contact Center

Board 1 — Customer Service & Case Management

The screenshot displays the TICVAI Board 1 interface, which is a central hub for customer service and case management. The interface is organized into several key sections:

- Top Navigation:** Includes 'All Brands' and date filters (01 May 2025 - 31 May 2025).
- Left Sidebar:** Contains 'CUSTOMER SERVICE' and 'QUICK ACTIONS' menus.
- Main Workspace:**
 - 10.1.1 CS Command Center:** A summary dashboard showing case counts (42 Open, 15 New, 26 Due Today, 8 SLA At Risk, 3 SLA Breached) and a table of cases with columns for Case ID, Customer, Subject, Priority, Status, SLA Remaining, and Last Interaction.
 - 10.1.2 Customer 360° Service Profile:** A detailed profile for John Smith (Gold Member), including contact information, membership details, and a list of recent interactions.
 - 10.1.3 Unified Interaction & Communication History:** A timeline of all interactions with the customer, including chat and email messages.
 - 10.1.4 Case Creation, Classification & Intelligent Routing:** A form for creating new cases, with AI-assisted classification and routing suggestions.
 - 10.1.5 Case Investigation & Resolution Workspace:** A detailed view of a specific case (CS-10502), showing a timeline of events, a list of recommended actions, and a resolution history.
 - 10.1.6 Order, Booking & Ticket Service Workspace:** A section for managing orders, bookings, and tickets, including a table of order details and a list of service actions.
 - 10.1.7 Refund, Compensation & Service Exception Workspace:** A section for managing refunds, compensation, and service exceptions.
 - 10.1.8 Escalation, Collaboration & Internal Resolution:** A section for handling escalations and collaborating with internal teams for resolution.
 - 10.1.9 Case Resolution, Closure & Customer Feedback:** A section for finalizing case resolution, providing feedback, and managing customer satisfaction.
 - 10.1.10 AI Customer Service Copilot & Knowledge Workspace:** A section for AI-assisted customer service and knowledge base management.

10 Backend Screens

Board Objective

Board 1 creates the **central servicing workspace** for TICVAI customer-service agents.

The goal is not to rebuild Ticketing, CRM, Finance, Membership, Wallet, Group Sales, or Payments. Instead, this board gives agents **one operational layer across all of those modules**.

An agent should be able to:

Find Customer → Understand Customer → See Interactions → Create Case → Investigate → Service Order/Ticket → Request Exception → Collaborate/Escalate → Resolve → Use AI Assistance

The key principle should be:

The customer-service agent should not need to understand TICVAI's internal module structure to solve a customer's problem.

Screen 10.1.1 — Customer Service Command Center

Purpose

Provide every customer-service agent with a personalized operational workspace showing customers, cases, tasks, SLAs, alerts and workload.

Agent KPIs

Display:

- My Open Cases
- New Cases
- Cases Due Today
- SLA At Risk
- SLA Breached
- Awaiting Customer
- Awaiting Internal Team
- Escalated Cases
- Resolved Today
- Average Resolution Time

My Work Queue

Display:

- Case ID
- Customer
- Subject
- Category
- Channel
- Priority
- Status
- Assigned Agent
- SLA Remaining
- Last Interaction
- Next Action

Priority Indicators

Use:

Critical / High / Medium / Normal / Low

Case Status

Recommended:

New → Assigned → In Progress → Waiting Customer → Waiting Internal → Escalated → Resolution Proposed → Resolved → Closed

Today's Tasks

Show:

- Call customer
- Review refund request
- Follow up Finance
- Reissue ticket
- Respond to complaint

- Request supervisor approval

Live Alerts**Examples:****SLA Risk — CS-10482**

Refund complaint must receive a response within 24 minutes.

Customer Waiting

Customer replied to case CS-10502 five minutes ago.

Quick Actions

- New Case
- Find Customer
- Find Order
- Find Ticket
- Find Booking
- Assign Case
- Escalate
- Open AI Assistant

AI Capability**AI should prioritize cases based on:**

- SLA
- Customer impact
- Transaction value
- Event proximity
- Customer sentiment
- Case age
- Operational urgency

Acceptance Condition

An agent can immediately understand their workload, priorities, SLA exposure and required actions without navigating multiple TICVAI modules.

Screen 10.1.2 — Customer 360° Service Profile

Purpose

Provide the agent with a complete customer-service view of the customer.

This should be one of the most important screens in the entire Customer Service module.

Customer Header**Display:**

- Customer Name

- Customer ID
- Customer Type
- Membership Status
- Loyalty Tier
- Preferred Language
- Country
- Contact Details
- Customer Since
- Customer Value
- Open Cases
- Risk/Attention Indicator

360° Navigation

Provide tabs for:

Overview

Orders

Tickets

Membership

Wallet

Payments

Group Bookings

Cases

Communications

Preferences

Customer Activity

Example:

Today

- Customer contacted support regarding ticket rescheduling.

Yesterday

- Purchased 4 tickets — AED 800.

Last Month

- Membership renewed.

Current Products

Show:

- Upcoming Tickets
- Active Membership
- Wallet Balance

- Active Reservations
- Future Group Booking where applicable
- Open Orders

Service Alerts

Examples:

Customer has an event tomorrow.

Customer has an unresolved refund case.

Membership expires in 12 days.

Customer Preferences

Display permitted information such as:

- Preferred Language
- Preferred Communication Channel
- Marketing Consent
- Accessibility Requirements where appropriately authorized
- Communication restrictions

Privacy Controls

Sensitive information should be:

- Role restricted
- Masked where appropriate
- Audited when accessed

AI Customer Summary

AI can produce:

Customer Summary

Customer has been active for three years, currently holds Gold membership and has four tickets for Saturday's event. They contacted support today requesting a date change. No previous service disputes recorded.

Architecture

CRM remains the source of truth for customer data.

This screen provides the **service-specific Customer 360 view**.

Acceptance Condition

Agents can understand the customer's complete TICVAI relationship and relevant service context from one screen.

Screen 10.1.3 — Unified Interaction & Communication History

Purpose

Provide one chronological timeline of customer interactions across supported service channels.

Supported Interaction Sources

Include:

- Email
- Phone
- Live Chat
- WhatsApp where integrated
- Web Form
- Mobile App
- B2C Portal
- Social channel where integrated
- POS/Front Desk
- Internal Notes
- Automated Notifications

Interaction Timeline**Example:****26 Aug — 14:32 — WhatsApp**

Customer requested ticket date change.

26 Aug — 14:38 — Agent

Agent requested order number.

26 Aug — 14:42 — Customer

Provided order #ORD-48291.

26 Aug — 14:45 — Case Created

CS-10482.

Interaction Record**Capture:**

- Date/Time
- Channel
- Customer
- Agent/System
- Direction
- Subject
- Related Case
- Related Order
- Related Ticket
- Attachments
- Sentiment where enabled

Search**Search interaction history by:**

- Keyword
- Date
- Channel
- Agent
- Case
- Order
- Ticket

AI Capability

AI can summarize long interaction histories.

Example:

Customer contacted TICVAI three times regarding the same refund. The first request was submitted eight days ago and is currently awaiting Finance review.

Acceptance Condition

Agents can see the complete relevant conversation history without searching separate communication systems.

Screen 10.1.4 — Case Creation, Classification & Intelligent Routing

Purpose

Create structured customer-service cases and ensure they reach the correct team.

Case Creation

Capture:

- Customer
- Subject
- Description
- Source
- Category
- Subcategory
- Priority
- Venue
- Event
- Related Order
- Related Ticket
- Related Payment
- Related Membership
- Attachments

Case Categories

Configurable categories could include:

- Ticket Issue
- Booking Issue
- Payment
- Refund
- Reschedule
- Exchange
- Membership
- Loyalty
- Wallet
- Access Problem
- Complaint
- Technical Issue
- Group Booking
- Lost Ticket
- General Enquiry

Priority Calculation**Priority can consider:****Customer Selected Priority**

-

Business Rules

-

SLA

-

AI Assessment**Example****Customer writes:**

"My event starts in two hours and my tickets aren't appearing."

AI detects:

- Ticket issue
- Upcoming event
- High urgency

Recommended:

Category: Ticket Delivery

Priority: Critical

Queue: Event-Day Support

Duplicate Detection

TICVAI should identify potentially duplicate cases.

Intelligent Routing

Route according to:

- Category
- Venue
- Product
- Language
- Customer type
- Agent skill
- Workload
- Priority
- Event proximity

Acceptance Condition

Every service request becomes a properly categorized, prioritized and routed case with the appropriate business context attached.

Screen 10.1.5 — Case Investigation & Resolution Workspace

Purpose

Provide the primary workspace in which an agent investigates and resolves a case.

Case Header

Display:

- Case ID
- Customer
- Subject
- Category
- Priority
- Status
- SLA
- Owner
- Queue
- Created
- Last Updated

Workspace Layout

I recommend a three-panel interface:

Left — Customer Context

Customer profile and related products.

Center — Case Timeline

Conversation, notes, actions and investigation.

Right — Recommended Actions

Policies, knowledge, workflow and AI assistance.

Related Records**Agents can attach:**

- Order
- Ticket
- Payment
- Refund
- Membership
- Wallet Transaction
- Group Booking
- Access Event

Internal Notes**Support:**

- Private notes
- Mentions
- Department notes
- Attachments
- Action history

Case Actions

- Reply
- Call
- Add Note
- Change Status
- Assign
- Escalate
- Request Approval
- Link Record
- Create Task
- Resolve

AI Capability**AI can continuously summarize:**

Issue: Customer purchased four Saturday tickets but needs Sunday.

Policy: Rescheduling permitted until 24 hours before visit.

Current Status: Sunday 16:00 has availability.

Commercial Impact: AED 80 price difference.

Recommended Action: Offer Sunday 16:00 and collect AED 80 difference.

Acceptance Condition

An agent can investigate and progress a customer case from one workspace with all required customer, transaction, policy and communication context visible.

Screen 10.1.6 — Order, Booking & Ticket Service Workspace

Purpose

Allow customer-service agents to perform permitted ticket/order servicing without entering the underlying technical modules.

Universal Search

Search by:

- Order Number
- Ticket Number
- Booking Reference
- Customer
- Email
- Mobile
- QR Reference
- Event
- Payment Reference

Order View

Display:

- Order
- Customer
- Purchase Date
- Channel
- Products
- Tickets
- Event
- Date/Time
- Amount
- Payment
- Fulfillment
- Ticket Status

Permitted Service Actions

Depending on policy:

- Resend Ticket
- Download Ticket
- Reissue
- Transfer
- Change Name
- Reschedule
- Exchange
- Upgrade
- Cancel
- Request Refund

Policy Evaluation

Before showing an action, TICVAI should evaluate:

Ticket/Product Policy

-

Service Policy

-

Order Status

-

Event Date

-

Customer Entitlement

→ Available Service Actions

Example

Reschedule

Current:

Saturday 16:00

Available:

Sunday 14:00 — +AED 0

Sunday 16:00 — +AED 20/ticket

Guardrail

Agents should not be able to bypass underlying Ticketing or Pricing rules simply because they work in Customer Service.

Acceptance Condition

Agents can perform authorized ticket and booking service actions through one customer-service interface while underlying TICVAI services remain authoritative.

Screen 10.1.7 — Refund, Compensation & Service Exception Workspace

Purpose

Manage cases requiring money, compensation, goodwill or policy exceptions.

Request Types

Support:

- Full Refund
- Partial Refund
- Service Credit
- Wallet Credit
- Voucher
- Complimentary Ticket
- Fee Waiver
- Upgrade
- Discount
- Policy Exception

Financial Context

Display:

- Original Transaction
- Amount Paid
- Amount Used
- Refundable Amount
- Previous Refund
- Fees
- Proposed Refund
- Proposed Compensation

Policy Evaluation

Show:

Standard Policy

Refund not permitted within 24 hours.

Requested Exception

Full refund requested due to venue closure.

Approval Matrix

Example:

Up to AED 200

Agent permitted.

AED 201–1,000

Supervisor approval.

Above AED 1,000

Manager/Finance approval.

Compensation Budget

Where configured, track agent/team goodwill limits.

AI Decision Support**AI can explain:**

Venue closure is recorded for the customer's visit period. A full refund is consistent with the applicable cancellation policy.

Or:

Customer is requesting a full refund for a valid used ticket. Standard policy does not permit refund; supervisor exception would be required.

Important Rule

AI must **never invent a policy exception**.

Acceptance Condition

Refunds, compensation and service exceptions are governed by applicable policies, financial limits and approval authorities.

Screen 10.1.8 — Escalation, Collaboration & Internal Resolution

Purpose

Allow Customer Service to collaborate with other TICVAI departments without losing ownership of the customer case.

Internal Teams**Cases may involve:**

- Ticketing
- Finance
- Operations
- Access Control
- Membership
- CRM
- F&B
- Retail
- Group Sales
- Technical Support
- Venue Management
- Management

Collaboration Model

Instead of forwarding the entire case, Customer Service should create an **internal action/request**.

Example:

Customer Case CS-10482

Finance Action:

Confirm refund transaction status.

Customer Service remains the customer-facing owner.

Internal Request

Capture:

- Department
- Assignee
- Request
- Priority
- Due Date
- Related Case
- Related Transaction
- Attachments

Escalation Types

- Functional Escalation
- Supervisor Escalation
- Management Escalation
- Technical Escalation
- Financial Escalation
- Emergency/Event-Day Escalation

SLA

Internal escalation should have its own response target.

Collaboration Timeline

Customer-facing and internal activities should remain distinguishable.

AI Capability

AI can recommend the correct internal team based on issue context.

Acceptance Condition

Agents can obtain assistance from internal departments while retaining one customer-facing case, owner and audit trail.

Screen 10.1.9 — Case Resolution, Closure & Customer Feedback

Purpose

Govern how cases are resolved and formally closed.

Resolution Record

Capture:

- Resolution Category
- Resolution Summary
- Action Taken
- Financial Impact
- Compensation
- Root Cause
- Resolved By
- Resolution Date
- Customer Notification

Resolution Categories

Examples:

- Information Provided
- Ticket Reissued
- Booking Changed
- Refund Processed
- Compensation Issued
- Technical Issue Resolved
- Customer Error
- Policy Applied
- Duplicate
- No Action Required

Root Cause

Capture:

- Customer
- Product
- Payment
- System
- Integration
- Operational
- Content
- Policy
- Staff
- Unknown

Closure Validation

Before closure, ensure:

- Required customer response sent
- Financial action complete or tracked
- Internal tasks completed
- Required approvals complete
- Resolution documented

Customer Feedback**Where configured, send:**

- CSAT survey
- Service rating
- Feedback request

Reopen**Cases can reopen when:**

- Customer replies
- Resolution fails
- Refund fails
- Supervisor reopens

AI Capability

AI can draft a resolution summary and customer response for agent approval.

Acceptance Condition

Every closed case has a clear resolution, root cause, customer communication and auditable outcome.

Screen 10.1.10 — AI Customer Service Copilot & Knowledge Workspace

Purpose

Create the AI intelligence layer assisting agents throughout the service journey.

This should not be a simple chatbot added to the side of the screen.

It should understand the **customer + transaction + policy + case context**.

AI Context**The Copilot can use authorized data from:**

- Customer
- Cases
- Orders
- Tickets
- Products
- Service Policies

- Pricing
- Payments
- Membership
- Wallet
- Group Bookings
- Interaction History
- Knowledge Base

Natural-Language Questions

Agents can ask:

“Why can't this customer reschedule?”

“What refund is this customer entitled to?”

“Find Sunday's available alternatives.”

“Summarize everything that happened on this case.”

“Has this customer contacted us before about this order?”

“What should I do next?”

AI Recommended Actions

Example:

Recommended Resolution

Move 4 tickets from Saturday 16:00 to Sunday 16:00.

Price difference: AED 80.

Rescheduling is permitted under Policy SP-22.

No supervisor approval required.

Actions:

Review → Execute

Knowledge Assistance

AI should retrieve relevant:

- Service procedures
- Product information
- Refund rules
- Ticket policies
- Venue instructions
- FAQs
- Internal SOPs

Response Drafting

Generate drafts for:

- Email

- Chat
- WhatsApp
- Case response
- Internal escalation

taking into account:

- Customer language
- Brand tone
- Case context
- Applicable policy

AI Guardrails**The Copilot must clearly distinguish:****Verified system data****Applicable policy****AI recommendation****It should not fabricate:**

- Refund eligibility
- Availability
- Payment status
- Ticket validity
- Customer balances

Agent Approval

Customer-facing messages and material actions should remain subject to human approval unless explicitly governed automation has been configured.

AI Learning Opportunity

Aggregate case patterns can identify systemic problems.

Example:

184 customers contacted support this week about the same mobile-ticket delivery issue.

This can trigger a broader operational incident rather than continuing to treat every case independently.

Acceptance Condition

Agents receive explainable, context-aware AI assistance that reduces handling time and improves consistency without bypassing TICVAI's policies, permissions or transactional systems.

Board 1 — Final Screen Register

Screen	Backend Screen	Primary Responsibility
10.1.1	Customer Service Command Center	Agent workload & priorities
10.1.2	Customer 360° Service Profile	Complete customer context
10.1.3	Unified Interaction & Communication History	Omnichannel interaction timeline
10.1.4	Case Creation, Classification & Intelligent Routing	Case intake and routing
10.1.5	Case Investigation & Resolution Workspace	Primary agent workspace
10.1.6	Order, Booking & Ticket Service Workspace	Transaction servicing
10.1.7	Refund, Compensation & Service Exception Workspace	Financial/service exceptions
10.1.8	Escalation, Collaboration & Internal Resolution	Cross-department collaboration
10.1.9	Case Resolution, Closure & Customer Feedback	Resolution and closure
10.1.10	AI Customer Service Copilot & Knowledge Workspace	AI-assisted servicing

Board 1 End-to-End Flow

Customer Arrives → Identify Customer → Understand History → Create/Route Case → Investigate → Service Transaction → Handle Exception → Collaborate → Resolve → Learn

Critical TICVAI Architecture

I recommend we make this requirement explicit in the development SOW:

Customer Service is an orchestration layer, not a duplicate transaction engine.

For example, when an agent presses **“Reschedule Ticket”**, Customer Service should call the existing **Ticketing + Schedule + Capacity + Pricing + Payment** services.

When the agent presses **“Refund”**, it should consume the applicable **Service Policy + Order + Payment + Finance** services.

And when the agent opens **Customer 360°**, it should aggregate authorized information from **CRM + Ticketing + Membership + Wallet + Group Sales + Payments + Cases**.

This gives TICVAI something much more powerful than a traditional helpdesk: **one AI-assisted service cockpit across the entire platform.**

Customer Service, Case Management & Contact Center

Board 2 — Contact Center Operations, SLA, Quality & AI Intelligence

Board Objective

Board 1 focused on the **individual customer-service agent and individual customer case**.

Board 2 moves one level higher and provides the **supervisor, contact-center manager, operations manager and service leadership layer**.

It answers:

What is happening across Customer Service? → How are cases distributed? → Who should handle them? → Are SLAs being met? → Is workload balanced? → What is being escalated? → Are agents delivering quality service? → Are customers satisfied? → Why are customers contacting us? → What should AI recommend or automate?

The end-to-end management flow is:

Monitor → Queue → Route → Control SLA → Balance Workforce → Escalate → Measure Quality → Measure Customer Experience → Analyze → AI Optimize

Screen 10.2.1 — Contact Center Operations Command Center

Purpose

Provide supervisors and management with a real-time view of customer-service operations across TICVAI.

Executive KPIs

Display:

- Cases Today
- Open Cases
- Unassigned Cases
- Customers Waiting
- Critical Cases
- SLA At Risk
- SLA Breached
- Cases Resolved Today
- First Response Time
- Average Resolution Time
- First Contact Resolution
- CSAT
- Active Agents
- Agent Utilization

Channel Overview

Show workload by:

- Email
- Phone
- Live Chat
- WhatsApp
- Web Form
- Mobile App
- B2C Portal
- Social channels where integrated
- Front Desk/POS

Queue Health

Example:

Queue	Open	Waiting	SLA Risk	Agents	Health
General Support	86	12	4	8	Healthy
Refunds	41	18	9	4	Warning
Event-Day Support	27	8	6	5	Critical
Membership	18	3	1	3	Healthy

Live Operational Feed

Examples:

Event-Day Support queue increased 42% during the last 30 minutes.

Refund queue has 11 cases approaching SLA breach.

WhatsApp response time is currently 8 minutes above target.

Drill-Down

Managers should be able to click:

Channel → Queue → Agent → Case

without leaving the command center.

AI Capability

AI should provide an operational summary such as:

Current Service Risk — High

Event-Day Support demand is 36% above forecast. Six cases relate to ticket-delivery failures for the same event. Recommend opening a linked incident and temporarily assigning two multilingual agents from General Support.

Acceptance Condition

Supervisors can understand the real-time operational state of Customer Service and identify the queues, channels and issues requiring immediate intervention.

Screen 10.2.2 — Queue Configuration & Management

Purpose

Configure and operate the queues through which customer-service cases are organized.

Queue Types

Support configurable queues such as:

- General Enquiries

- Ticketing
- Refunds
- Payments
- Membership
- Wallet
- Group Sales Support
- B2B Support
- Access Control
- Complaints
- Technical Support
- VIP Support
- Event-Day Support

Queue Configuration

Configure:

- Queue Name
- Queue Code
- Department
- Brand
- Venue
- Market
- Languages
- Supported Channels
- Operating Hours
- Priority
- SLA Profile
- Supervisor
- Backup Queue

Queue Membership

Assign:

- Agents
- Supervisors
- Teams
- Skills

Queue Rules

Configure:

- Maximum workload

- Overflow threshold
- Escalation threshold
- After-hours behavior
- Backup routing
- VIP handling
- Emergency handling

Live Queue Controls

Authorized supervisors can:

- Open Queue
- Pause Queue
- Redirect
- Activate Overflow
- Reassign Work
- Change Priority
- Activate Emergency Mode

Example

If:

Event-Day Support waiting cases > 30

then:

Route qualified Ticketing agents from General Support into Event-Day Support.

AI Capability

AI can recommend queue restructuring based on historical demand patterns.

Acceptance Condition

Administrators can configure specialized service queues and supervisors can operationally adjust them without changing application code.

Screen 10.2.3 — Intelligent Routing, Skills & Assignment Engine

Purpose

Determine the best agent or team to handle each customer request.

Routing Inputs

The routing engine should consider:

- Case Category
- Subcategory
- Channel
- Customer Language
- Customer Type

- Membership Tier
- Venue
- Event
- Product
- Priority
- SLA
- Agent Skill
- Agent Availability
- Current Workload
- Event Proximity

Agent Skills

Examples:

- Ticketing
- Refunds
- Payments
- Membership
- Arabic
- English
- VIP Customers
- Group Sales
- Technical Support
- Event-Day Operations

Routing Strategies

Support:

Round Robin

Least Busy

Skill Based

Priority Based

Language Based

Customer Tier Based

AI Recommended

Assignment Preview

Before assignment, display:

Case: Ticket reschedule

Language: Arabic

Priority: High

Recommended:

Agent: Sara Ahmed**Reason:**

- Arabic skill ✓
- Ticketing skill ✓
- Current workload 62% ✓
- SLA capability ✓

Manual Override

Supervisors may override automated routing with reason capture.

Sticky Ownership

Where useful, TICVAI can prioritize the same agent for a returning customer or reopened case.

AI Capability

AI can continuously optimize routing based on resolution performance, not merely workload.

Acceptance Condition

Customer cases are routed to appropriately skilled and available agents using governed routing rules with transparent assignment logic.

Screen 10.2.4 — SLA Policy & Service-Level Management

Purpose

Define and monitor service-level commitments for different customer-service scenarios.

SLA Types**Configure:**

- First Response SLA
- Next Response SLA
- Resolution SLA
- Internal Escalation SLA
- Refund Processing SLA
- Complaint Resolution SLA

SLA Dimensions**Different targets can apply by:**

- Case Type
- Priority
- Channel
- Customer Tier
- Brand
- Venue
- Event

- Market
- Partner
- Group Customer

Example

Critical Event-Day Issue

First Response: **5 minutes**

Resolution Target: **30 minutes**

Normal General Enquiry

First Response: **4 hours**

Resolution Target: **24 hours**

SLA Clock

Support:

- Calendar time
- Business hours
- Venue operating hours
- Paused states
- Holiday calendars

SLA Pause

Example:

Case status:

Waiting Customer

can pause the resolution clock where policy allows.

Escalation Thresholds

Example:

50% consumed → Agent warning

75% consumed → Supervisor warning

90% consumed → Escalation

100% consumed → Breach

SLA Dashboard

Display:

- Within SLA
- At Risk
- Breached
- Average Response
- Average Resolution
- SLA Compliance %

AI Capability

AI can forecast likely breaches before static thresholds are reached.

Based on queue volume and current agent workload, 17 Refund cases are likely to breach within the next 90 minutes.

Acceptance Condition

TICVAI can enforce and monitor differentiated service-level commitments and proactively identify cases likely to breach.

Screen 10.2.5 — Agent Workload, Availability & Workforce Control

Purpose

Give supervisors visibility and control over active customer-service resources.

Agent Status

Support/reference:

- Available
- Busy
- On Call
- Chatting
- After Call Work
- Break
- Training
- Offline

Agent Table

Display:

- Agent
- Team
- Skills
- Languages
- Status
- Active Cases
- Chats
- Calls
- Queue
- SLA Risk Cases
- Average Handle Time
- Resolution Rate
- Utilization

Workload Visualization

Example:

Ahmed — 92% — Overloaded

Sara — 61% — Normal

Emma — 38% — Available

Supervisor Actions

Authorized supervisors can:

- Reassign Cases
- Move Agent Between Queues
- Activate Overflow
- Change Availability
- Assign Priority Case
- Request Assistance

Resource Management Integration

Agent schedules, rosters and attendance should come from TICVAI Resource/Workforce Management where applicable.

This screen should not create a duplicate staff rostering engine.

AI Workload Balancing

AI can recommend:

Move two English/Arabic agents from General Enquiries to Refunds for the next 90 minutes.

Acceptance Condition

Supervisors can understand workload distribution and rebalance service resources before queue or SLA performance deteriorates.

Screen 10.2.6 — Escalation & Critical Case Monitor

Purpose

Provide supervisors with one workspace for cases requiring elevated attention.

Escalation Dashboard

Display:

- Escalated Cases
- Critical Cases
- SLA Breaches
- VIP Escalations
- Financial Escalations
- Event-Day Escalations
- Management Escalations

- Technical Escalations

Escalation Record

Display:

- Case
- Customer
- Reason
- Priority
- Transaction Value
- Event
- Assigned Agent
- Escalated To
- Escalation Time
- SLA
- Current Status

Escalation Reasons

Examples:

- SLA Risk
- Customer Complaint
- Repeated Contact
- High Value
- Refund Exception
- Operational Failure
- System Failure
- Legal/Compliance Concern
- VIP Customer
- Supervisor Requested

Major Issue Detection

This screen should identify when many cases are symptoms of one problem.

Example:

Potential Major Incident

84 cases in 37 minutes reference missing mobile tickets for Dubai Arena Event #EVT-2204.

Actions:

Create Incident / Link Cases / Notify Operations / Publish Service Message

AI Capability

AI should cluster related cases and detect emerging service incidents.

This is important because 100 customers reporting the same issue should not be treated as 100 unrelated problems.

Acceptance Condition

Supervisors can identify, coordinate and resolve critical escalations and systemic service incidents from one central workspace.

Screen 10.2.7 — Quality Management & Agent Evaluation

Purpose

Measure whether customer-service interactions meet TICVAI's defined service-quality standards.

Quality Evaluation

Score interactions against configurable criteria such as:

- Greeting
- Customer Verification
- Understanding
- Accuracy
- Policy Compliance
- Communication Quality
- Empathy
- Resolution
- Documentation
- Closing

Quality Score

Example:

Agent QA Score — 91/100

Evaluation Sources

Support:

- Call
- Chat
- Email
- WhatsApp
- Case
- Complaint

Review Workflow

Interaction Selected

→ **Evaluator Reviews**

→ **Score Generated**

→ **Feedback**

→ **Agent Acknowledgment**

→ Coaching if required**Critical Failures****Examples:**

- Incorrect refund
- Customer privacy violation
- Unauthorized compensation
- Incorrect ticket information
- Security verification failure

These can override the overall quality score.

AI-Assisted QA**Where supported, AI can evaluate large samples for:**

- Policy adherence
- Required statements
- Tone
- Accuracy
- Resolution quality
- Missing case documentation

Human evaluators can review AI findings.

Coaching**Generate coaching actions such as:**

- Product Training
- Policy Training
- Communication Coaching
- System Training

Acceptance Condition

TICVAI can consistently evaluate service quality across agents and channels and convert quality findings into measurable coaching actions.

Screen 10.2.8 — Customer Satisfaction, Feedback & Voice of Customer**Purpose**

Measure customer perception of TICVAI's support experience and identify recurring service problems.

Feedback Sources**Support:**

- CSAT
- Service Rating

- NPS where used
- Post-Case Survey
- Complaint
- App Feedback
- Web Feedback
- Direct Customer Comment

KPIs**Display:**

- CSAT
- Survey Response Rate
- Positive %
- Neutral %
- Negative %
- Complaints
- Repeat Contact Rate
- Customer Effort where measured

Analysis**Break down feedback by:**

- Agent
- Team
- Venue
- Product
- Event
- Case Type
- Channel
- Customer Type
- Language

Customer Comments**Show customer feedback with:**

- Sentiment
- Topic
- Case
- Agent
- Product/Event
- Rating

AI Voice-of-Customer Analysis

AI can group comments into themes:**Ticket Delivery — 32%****Refund Delay — 21%****Website Checkout — 16%****Staff Service — 12%****Other — 19%****Trend Detection****Example:**

Negative feedback relating to ticket delivery increased 47% after the latest mobile-app release.

Closed-Loop Feedback**High-risk negative feedback can automatically create:**

- Follow-up Case
- Supervisor Task
- Complaint Review

Acceptance Condition

Management can understand what customers think about the service experience and trace negative trends back to their underlying operational causes.

Screen 10.2.9 — Service Analytics & Root-Cause Intelligence**Purpose**

Provide comprehensive analytics explaining **why customers contact TICVAI and what is driving service demand.**

Core KPIs**Analyze:**

- Contact Volume
- Cases
- First Response Time
- Resolution Time
- First Contact Resolution
- Reopen Rate
- Escalation Rate
- SLA Compliance
- Cost per Case where available
- CSAT
- Refund Requests
- Complaint Rate

Contact Drivers**Show:****Ticket Delivery****Refund****Reschedule****Payment Failure****Membership****Access Issue****Group Booking****General Information****Trend Analysis****Compare:**

- Today vs Yesterday
- Week vs Week
- Month vs Month
- Event vs Event
- Venue vs Venue
- Product vs Product

Root-Cause Analysis

Connect service demand to underlying platform activity.

Example:**2,480 support cases**

↓

620 Payment Cases

↓

418 relate to one payment gateway

↓

352 occurred during a 46-minute incident**Avoidable Contact****AI should identify cases that could have been prevented through:**

- Better B2C information
- Self-service
- Product configuration
- Improved notifications
- Technical fixes
- Better ticket delivery

Example

18% of customer contacts this month relate to questions about parking. Adding parking instructions to pre-visit communications could reduce approximately 2,100 monthly contacts.

Acceptance Condition

Management can move beyond reporting case volumes and identify the actual product, process and technology issues generating customer demand.

Screen 10.2.10 — AI Contact Center Intelligence & Automation Studio

Purpose

Create the management-level AI intelligence layer for Customer Service.

This is different from **10.1.10 AI Customer Service Copilot**.

Board 1 Copilot = helps one agent resolve one case.

Board 2 AI Intelligence = improves the entire service operation.

AI Inputs

Analyze governed information from:

- Cases
- Interactions
- Queues
- SLA
- Agent Performance
- QA
- Customer Feedback
- Orders
- Tickets
- Payments
- Products
- Events
- System Incidents

AI Management Questions

Managers should be able to ask:

“Why did service volume increase today?”

“Which queues will breach SLA tonight?”

“What are customers complaining about this week?”

“Which issues are creating unnecessary contacts?”

“Which agents need additional training?”

“Which events are generating the most customer problems?”

AI Forecasting

Forecast:

- Contact Volume
- Queue Demand
- Required Agents
- SLA Risk
- Expected Complaints
- Event-Day Support Demand

AI Recommendations**Workforce**

Schedule four additional Arabic-speaking agents between 17:00–20:00 for Friday's event.

Self-Service

31% of ticket-resend cases can potentially be resolved through automated B2C self-service.

Product Improvement

Clarify children's age eligibility on the product page; it generated 486 enquiries this month.

Operational Improvement

Gate 3 produces 2.7× more access-related complaints than other gates.

Incident Detection

62 cases in 20 minutes indicate a likely payment-gateway incident.

Automation Studio

Allow administrators to define governed AI-assisted automations.

Example:**IF**

Customer requests ticket resend

AND

Ticket is valid

AND

Customer identity is verified

THEN

Automatically resend ticket and record case resolution.

Another example:**IF**

5+ cases report identical payment error within 10 minutes

THEN

Create potential incident and notify supervisor.

Automation Levels**I recommend four governance levels:**

Level 1 — Recommend Only

AI suggests action.

Level 2 — Agent Confirmation

AI prepares action; agent approves.

Level 3 — Supervisor-Governed Automation

Approved low-risk workflows execute automatically.

Level 4 — Fully Automated Low-Risk Service

Only specifically approved scenarios.

Simulation

Before activating an automation, TICVAI should simulate historical impact:

Had this rule been active last month:

3,840 cases could have been automatically resolved.

Estimated agent hours saved: **612 hours**.

Estimated automation confidence: **96.4%**.

AI Governance

Every AI automation must have:

- Owner
- Version
- Scope
- Trigger
- Allowed Actions
- Confidence Threshold
- Exception Handling
- Approval
- **Audit Trail**
- Effective Dates
- Kill Switch

Acceptance Condition

TICVAI can use explainable AI to forecast demand, identify systemic service issues and automate approved low-risk workflows without removing governance over customer-impacting decisions.

Board 2 — Final Screen Register

Screen	Backend Screen	Primary Responsibility
10.2.1	Contact Center Operations Command Center	Real-time service operations

Screen	Backend Screen	Primary Responsibility
10.2.2	Queue Configuration & Management	Queue administration
10.2.3	Intelligent Routing, Skills & Assignment Engine	Case distribution
10.2.4	SLA Policy & Service-Level Management	SLA governance
10.2.5	Agent Workload, Availability & Workforce Control	Workforce balancing
10.2.6	Escalation & Critical Case Monitor	Escalation/incident management
10.2.7	Quality Management & Agent Evaluation	QA and coaching
10.2.8	Customer Satisfaction, Feedback & Voice of Customer	Customer experience
10.2.9	Service Analytics & Root-Cause Intelligence	Analytics/root cause
10.2.10	AI Contact Center Intelligence & Automation Studio	AI optimization & automation

Area 10 — Complete Structure

With Board 2, Area 10 contains 2 boards / 20 backend screens.

Board 1 — Resolve the Customer

Find → Understand → Create Case → Investigate → Service → Exception → Escalate → Resolve → AI Assist

Board 2 — Operate the Service Organization

Monitor → Queue → Route → SLA → Workforce → Escalate → Quality → Listen → Analyze → AI Optimize

Critical distinction

There are two separate AI layers, and I recommend keeping both:

AI Customer Service Copilot — Board 1:

“Help this agent solve this customer's problem.”

AI Contact Center Intelligence — Board 2:

“Help management improve the entire customer-service operation.”

That distinction will make the TICVAI Customer Service module much stronger and prevent the common mistake of treating an AI chatbot as the complete AI strategy for customer service.
