

Order & Reservation Management

Functional Design & Backend Screens

TICVAI | Professional Reference Document

Table of Contents

Area 12 — Order & Reservation Management

Board 1 — Order & Reservation Lifecycle

- 12.1.1 — Order & Reservation Command Center
- 12.1.2 — Order Detail & Transaction Workspace
- 12.1.3 — Reservation & Hold Policy Configuration
- 12.1.4 — Order & Reservation Status Lifecycle Configuration
- 12.1.5 — Order Creation & Source/Channel Configuration
- 12.1.6 — Customer, Guest & Account Assignment
- 12.1.7 — Order Line, Product & Entitlement Composition
- 12.1.8 — Capacity Reservation & Inventory Commitment
- 12.1.9 — Reservation Confirmation, Expiry & Fulfillment Readiness
- 12.1.10 — Order Lifecycle Timeline, SLA, Exceptions & AI Operations

Board 1 — Final Screen Register

Board 2 — Amendments, Cancellations, Refunds, Voids & Reissues

- 12.2.1 — Amendment & After-Sales Command Center
- 12.2.2 — Order Amendment Workspace
- 12.2.3 — Amendment Eligibility & Policy Rule Builder
- 12.2.4 — Cancellation & Partial Cancellation Policy Configuration
- 12.2.5 — Refund Policy & Refund Calculation Configuration
- 12.2.6 — Void, Reversal & Same-Day Correction Management
- 12.2.7 — Ticket Reissue & Fulfillment Regeneration
- 12.2.8 — After-Sales Financial Settlement & Adjustment Workspace
- 12.2.9 — Approval, Exception & Service Recovery Management
- 12.2.10 — Amendment History, Audit & After-Sales Analytics

Board 2 — Final Screen Register

Board 3 — Payments, Order Structure, Reconciliation & Traceability

- 12.3.1 — Payment & Order Financial Command Center
- 12.3.2 — Order Payment Detail & Transaction Ledger
- 12.3.3 — Multi-Payment, Split Tender & Payment Allocation Configuration
- 12.3.4 — Deposit, Partial Payment & Outstanding Balance Management
- 12.3.5 — Order Split, Merge & Transaction Relationship Management
- 12.3.6 — Related Order & Transaction Relationship Explorer
- 12.3.7 — External Payment, Partner & Settlement Reference Mapping
- 12.3.8 — Payment Reconciliation & Exception Management
- 12.3.9 — Financial Traceability, Control & Audit Explorer
- 12.3.10 — Order Financial Analytics & AI Reconciliation Intelligence

Board 3 — Final Screen Register

Board 1 — Order & Reservation Lifecycle Creates and governs the core order/reservation.

Area 12 — Order & Reservation Management

Board 1 — Order & Reservation Lifecycle

10 Backend Configuration Screens — Detailed SOW

Board 1 should establish the **core transactional backbone** of TICVAI. Every sale—whether originating from B2C, POS, Call Center, Kiosk, B2B, reseller, OTA, mobile app, or API—should ultimately create or interact with the same governed Order & Reservation Engine.

The architecture should be:

Channel / Customer → Cart or Agent Selection → Reservation/Hold → Inventory & Capacity Lock → Order Creation → Customer Assignment → Pricing Snapshot → Confirmation → Fulfillment → Completion / Expiry

A critical principle for SoftLab:

There should not be separate order engines for POS, B2C, B2B, Kiosk, etc. All channels should use the same centralized Order & Reservation domain/services, with channel-specific permissions and journeys on top.

12.1.1 — Order & Reservation Command Center

Purpose

Provide the central operational workspace for searching, monitoring, opening, and managing every order and reservation across TICVAI.

KPI Cards

Display:

- Orders Today
- Confirmed Orders
- Active Reservations
- Temporary Holds
- Pending Payment
- Expiring Reservations
- Failed Orders
- Partially Fulfilled
- Completed Orders
- Cancelled Orders
- Orders Requiring Attention
- Gross Order Value

Universal Search

Search using:

- Order Number
- Reservation Number
- Ticket Number
- Customer Name
- Email
- Mobile
- Membership ID
- Transaction Reference
- Payment Reference
- External Partner Reference
- Barcode / QR
- Event
- Product

Order Directory

Display:

- Order ID
- Reservation ID
- Customer
- Channel
- Venue
- Product/Event
- Order Value
- Payment Status
- Reservation Status
- Fulfillment Status
- Created Date
- Expiry

- Owner/Agent

Status Indicators

Examples:

Reserved / Awaiting Payment / Confirmed / Partially Fulfilled / Fulfilled / Completed / Expired / Cancelled / Failed / Under Review

Operational Alerts

Examples:

38 reservations expire within the next 15 minutes.

7 confirmed orders have fulfillment failures.

4 OTA orders contain synchronization exceptions.

Quick Actions

Depending on permission:

- Open Order
- Open Reservation
- Extend Hold
- Resend Confirmation
- Collect Payment
- Add Note
- View Timeline

Amendment/refund actions route to Board 2 rather than being recreated here.

AI Assistance

AI may summarize:

“Most pending orders are B2B reservations awaiting payment. AED 182,400 is currently held against inventory.”

Acceptance Condition

Authorized users can locate and monitor any TICVAI order/reservation across all channels from one centralized operational workspace.

12.1.2 — Order Detail & Transaction Workspace

Purpose

Provide the authoritative **360-degree view of a single order**.

This should become one of the most important operational screens in TICVAI.

Order Header

Display:

- Order Number
- Order Date/Time
- Order Status
- Reservation Status
- Customer
- Channel
- Sales Location

- Cashier/Agent
- Currency
- Total
- Payment Status
- Fulfillment Status

Order Lines

Each line should display:

- Product
- Ticket Type
- Event
- Performance
- Date
- Timeslot
- Quantity
- Person Type
- Seat
- Unit Price
- Discount
- Tax
- Fee
- Total
- Ticket Status

Financial Summary

Display:

Subtotal

Discount

Fees

Tax

Paid

Refunded

Outstanding

Order Total

Financial calculations should reference the centralized Area 10 pricing/calculation engine.

Related Objects

Show:

- Customer
- Tickets
- Reservations
- Payments
- Refunds
- Invoices
- Credentials
- Membership

- Waivers
- Related Orders

Timeline

Example:

10:32 Order Created

10:33 Capacity Held

10:34 Payment Authorized

10:34 Order Confirmed

10:35 Tickets Issued

10:36 Email Sent

Internal Notes

Authorized users may add operational notes without changing the customer-facing order.

AI Order Summary

Example:

“Order contains four tickets for Saturday 18:00. Payment is complete. Three tickets were issued successfully; one credential failed and requires reprocessing.”

Acceptance Condition

The complete commercial, operational, customer, payment, ticket and fulfillment context of an order can be understood from one screen.

12.1.3 — Reservation & Hold Policy Configuration

Purpose

Configure how TICVAI temporarily reserves inventory before an order is fully confirmed.

Hold Types

Support:

- Cart Hold
- Checkout Hold
- Agent Reservation
- Group Reservation
- B2B Reservation
- Corporate Reservation
- Manual Hold
- Payment Hold
- Seat Hold
- Inventory Hold

Hold Duration

Configure by:

- Channel
- Product
- Event
- Performance
- Ticket Type

- Customer Segment
- Reservation Type

Example:**B2C Checkout:****10 minutes****Call Center:****20 minutes****B2B Group:****48 hours****Expiry Behavior****On expiry:**

- Release Inventory
- Release Seats
- Cancel Reservation
- Notify Customer
- Notify Agent
- Maintain Audit Record

Extension Rules**Configure:**

- Extension Allowed
- Maximum Extensions
- Extension Duration
- Authorized Role
- Approval Requirement

Example

Standard B2C holds cannot be manually extended.

Call Center supervisors may extend once for 15 minutes.

Hold Priority

Configure whether selected reservation types receive different inventory treatment.

Capacity Integration**Reservation must lock the applicable:**

- Admission Capacity
- Seat
- Inventory
- Timeslot Capacity
- Entitlement Capacity

through the central capacity/inventory services.

Acceptance Condition

TICVAI can consistently create, expire, extend, and release temporary reservations without overselling or orphaning inventory.

12.1.4 — Order & Reservation Status Lifecycle Configuration

Purpose

Define the governed state machine for orders and reservations.

SoftLab should **not hard-code status transitions independently in every channel**.

Reservation Lifecycle

Example:

Draft → Held → Reserved → Awaiting Payment → Confirmed

Alternative outcomes:

Expired / Cancelled / Failed

Order Lifecycle

Example:

Created → Pending Payment → Confirmed → Fulfillment → Completed

Alternative outcomes:

Cancelled / Partially Cancelled / Failed / Under Review

Configurable Transitions

For each transition define:

- From Status
- To Status
- Trigger
- Required Conditions
- User/System Action
- Allowed Role
- Integration Requirement
- Notification
- Audit Requirement

Trigger Types

Examples:

- Payment Success
- Payment Failure
- Reservation Expiry
- Manual Confirmation
- Inventory Confirmation
- Fulfillment Completion
- External Partner Confirmation

Invalid Transition Protection

Example:

A **Completed** order should not return directly to **Draft**.

System vs Manual Status

Distinguish:

- System-Controlled Status

- Operational Status
- User-Editable Status

Exception State

Allow:

Under Review / Reconciliation Required / Fulfillment Exception

without corrupting the underlying transaction.

Acceptance Condition

Every order and reservation follows a centralized, controlled and auditable lifecycle regardless of originating sales channel.

12.1.5 — Order Creation & Source/Channel Configuration

Purpose

Configure how orders can originate from different TICVAI sales channels while using one common transaction engine.

Supported Sources

- B2C Web
- Mobile App
- POS
- Mobile/Flying POS
- Kiosk
- Call Center
- Box Office
- B2B Portal
- Reseller
- OTA
- API
- Administrative Backend

Source Metadata

Capture:

- Channel
- Sub-Channel
- Sales Location
- Terminal
- Device
- Agent
- Partner
- Reseller
- Campaign
- Affiliate
- API Consumer
- External Reference

Order Numbering**Configure numbering rules:**

- Global Sequence
- Tenant Sequence
- Venue Sequence
- Channel Prefix
- Year/Month Prefix
- Custom Pattern

Example:**DXB-B2C-2026-00145892****External References****Support partner identifiers such as:**

- OTA Booking Reference
- Reseller Order ID
- ERP Reference
- External CRM Reference

Source Rules**Configure whether a channel may:**

- Create Reservation
- Create Immediate Order
- Create Unpaid Order
- Create Group Order
- Hold Inventory
- Issue Ticket Immediately

Idempotency

API/external channel requests should prevent accidental duplicate order creation from repeated requests.

Acceptance Condition

Orders from all TICVAI and external sales channels are created consistently while preserving complete source and attribution metadata.

12.1.6 — Customer, Guest & Account Assignment**Purpose**

Define how customers are identified and associated with orders/reservations.

Customer Modes**Support:**

- Guest Checkout
- Registered Customer
- Member
- Corporate Account
- B2B Account

- Group Organizer
- Anonymous Sale where permitted

Customer Data

Depending on configuration:

- Name
- Email
- Mobile
- Country
- Language
- Date of Birth
- Customer ID
- Membership ID
- Company
- Tax Details

Only collect fields required for the applicable transaction and configured compliance rules.

Buyer vs Attendee

TICVAI must distinguish:

Purchaser

from

Ticket Holder / Attendee

Example:

Parent purchases four tickets for family members.

Customer Matching

CRM integration should detect potential existing profiles based on approved identifiers.

Duplicate Prevention

Possible match:

"A customer with this email/mobile already exists."

Actions:

- Link Existing
- Continue Guest
- Review Match

depending on policy.

B2B Assignment

Orders can link to:

- Partner
- Corporate Account
- Reseller
- Agent
- Cost Center where applicable

Privacy

Customer association must respect the Privacy & Consent architecture rather than automatically using transactional information for marketing.

Acceptance Condition

Every order can correctly identify purchaser, attendee, member, corporate or partner relationships without creating unnecessary duplicate customer records.

12.1.7 — Order Line, Product & Entitlement Composition

Purpose

Manage the products and commercial components contained within an order.

Supported Order Lines

An order may contain:

- Tickets
- Memberships
- Add-Ons
- F&B
- Retail
- Rental
- Parking
- Experiences
- Packages
- Vouchers
- Other configured products

Line Structure

Each line captures:

- Product
- Variant
- Quantity
- Person Type
- Event
- Performance
- Date
- Timeslot
- Seat
- Entitlement
- Price
- Discount
- Tax
- Fee
- Fulfillment Method

Parent/Child Relationships

Support:

Bundle

- Admission Ticket
- Meal Voucher
- Fast Track

without treating unrelated lines as independent transactions.

Dependencies**Examples:**

Parking requires an admission ticket.

Fast Track requires General Admission.

Quantity Rules**Respect:**

- Product Limits
- Channel Limits
- Customer Limits
- Event Limits
- Capacity

Pricing Snapshot

When order line is created, preserve the commercial calculation snapshot used at that moment.

This is critical because prices may later change dynamically.

Example:

Current live price = AED 280

Customer's confirmed order price = AED 250

The historical order must not silently change.

Acceptance Condition

TICVAI can compose complex multi-product orders while preserving product relationships, entitlements, commercial calculations and fulfillment requirements.

12.1.8 — Capacity Reservation & Inventory Commitment

Purpose

Control when and how order activity consumes real capacity/inventory.

This is the transactional bridge between the **Order Engine** and the **Capacity/Inventory Engines**.

Reservation Levels**Support:****Soft Hold**

Temporary availability protection.

Hard Reservation

Committed to reservation but not fully sold.

Sold/Committed

Confirmed inventory consumption.

Capacity Types

Integrate with:

- General Admission Capacity
- Seat Inventory
- Timeslot Capacity
- Event Capacity
- Product Inventory
- Rental Inventory
- F&B/Retail inventory where applicable

Atomic Validation**For an order containing multiple capacity-dependent products:**

Either all required inventory can be reserved according to policy, or the transaction should return a controlled exception.

Example**Family order:**

4 Admission Tickets

- 4 Fast Track
- 1 Parking

TICVAI validates availability before confirming the complete transaction.

Oversell Protection

The order engine must respect configured capacity and oversell policies.

Release**Inventory is released when:**

- Hold Expires
- Reservation Cancels
- Payment Fails according to policy
- Order Fails
- Authorized amendment removes product

Concurrency Protection

Prevent two simultaneous customers from purchasing the same final seat/inventory unit.

Acceptance Condition

Order and reservation activity commits and releases capacity consistently without double-selling, lost inventory, or inconsistent transaction states.

12.1.9 — Reservation Confirmation, Expiry & Fulfillment Readiness

Purpose

Determine when a reservation becomes a confirmed order and when it is ready for ticket/media fulfillment.

Confirmation Conditions**Configure combinations of:**

- Payment Complete

- Deposit Received
- Credit Approved
- Capacity Confirmed
- Customer Data Complete
- Required Waiver Complete
- Required Approval Complete
- Partner Confirmation Received

Example — B2C

Payment Complete

- Capacity Confirmed

→ **Confirm Automatically**

Example — B2B

Credit Available

- Partner Authorized
- Capacity Confirmed

→ **Confirm Reservation**

Fulfillment Readiness

Before issuing ticket/media, validate:

- Order Confirmed
- Payment Condition Met
- Required Customer Data
- Entitlement Valid
- Waiver Requirement
- Credential Configuration
- Delivery Method

Partial Fulfillment

Configure whether partial fulfillment is allowed.

Example:

4 tickets:

3 issued successfully
1 failed.

Order status:

Partially Fulfilled

rather than incorrectly showing Completed.

Reservation Expiry

For unpaid/conditional reservations:

- Expire
- Release Capacity
- Update Status
- Notify relevant parties
- Preserve history

Fulfillment Handoff**Once ready, pass to:**

- Ticket Media
- Wallet Pass
- RFID/NFC
- Print
- Email Delivery
- Other credential services

Acceptance Condition

TICVAI only confirms and fulfills orders after all configured commercial, capacity, payment and compliance conditions have been satisfied.

12.1.10 — Order Lifecycle Timeline, SLA, Exceptions & AI Operations

Purpose

Provide complete lifecycle visibility and proactively identify orders/reservations that require operational intervention.

Unified Timeline**Show every event:**

Reservation Created
 Capacity Held
 Customer Assigned
 Price Calculated
 Payment Started
 Payment Authorized
 Order Confirmed
 Ticket Generated
 Email Sent
 Credential Activated

Event Details**For every event capture:**

- Timestamp
- Event Type
- User/System
- Channel
- Previous State
- New State
- Related Transaction
- Correlation ID
- Result

SLA Rules

Configure operational SLA thresholds.

Examples:

Pending Payment >15 minutes

Fulfillment after confirmation >2 minutes

External Partner Confirmation >5 minutes

Exception Categories

Detect:

- Stuck Order
- Orphan Reservation
- Payment/Order Mismatch
- Capacity Mismatch
- Missing Customer Data
- Fulfillment Failure
- External Synchronization Failure
- Duplicate Transaction Risk

Exception Queue

Prioritize by:

Critical / High / Medium / Low

Recovery Actions

Depending on exception:

- Retry
- Revalidate
- Release Hold
- Reprocess Fulfillment
- Escalate
- Send to Reconciliation
- Open Related Transaction

AI Operations

AI can detect patterns such as:

“OTA orders have a 4.7× higher confirmation delay during peak periods.”

or:

“12 reservations appear stuck because payment succeeded but order confirmation was not received.”

AI may recommend operational action but should not silently alter financial/order records outside configured automation policies.

Acceptance Condition

Operations teams can reconstruct the complete lifecycle of an order, identify abnormal transactions and safely recover exceptions through controlled actions.

Board 1 — Final Screen Register

#	Backend Screen	Core Responsibility
12.1.1	Order & Reservation Command Center	Central order/reservation operations
12.1.2	Order Detail & Transaction Workspace	Complete order 360
12.1.3	Reservation & Hold Policy Configuration	Holds and expiration
12.1.4	Order & Reservation Status Lifecycle Configuration	Transaction state machine
12.1.5	Order Creation & Source/Channel Configuration	Omnichannel order creation
12.1.6	Customer, Guest & Account Assignment	Customer/account relationship
12.1.7	Order Line, Product & Entitlement Composition	Order contents
12.1.8	Capacity Reservation & Inventory Commitment	Inventory/capacity locking
12.1.9	Reservation Confirmation, Expiry & Fulfillment Readiness	Confirmation and fulfillment
12.1.10	Order Lifecycle Timeline, SLA, Exceptions & AI Operations	Monitoring and recovery

Important Architecture Decisions to Freeze

There are **four principles I would explicitly include in the SoftLab SOW**.

- 1. One central Order Engine.** POS, B2C, B2B, OTA, Kiosk and Call Center must not maintain independent order logic. They are channels consuming the same order services.
- 2. Preserve the commercial snapshot.** Once an order is confirmed, TICVAI must preserve the exact price, discount, tax, fee, dynamic-pricing result and relevant rule/version that produced the transaction. Later configuration changes must not rewrite historical orders.
- 3. Reservation and inventory must be transactional.** TICVAI cannot create an order while capacity fails separately and leave the system inconsistent. Capacity locking, payment state, order confirmation and recovery need proper transaction orchestration.
- 4. Area 12 is the transaction orchestrator—not a duplicate of other modules.** Pricing stays in Area 10; upgrades/conversions stay in Area 11; ticket media stays in its credential module; CRM owns the customer master; payment services execute payments; capacity/inventory engines own availability. **Area 12 coordinates all of them into one governed commercial transaction.**

With this structure, **Board 1 is ready to freeze at exactly 10 screens**. The next step is to design all 10 screens exactly according to this SOW before proceeding to Board 2.

Area 12 — Order & Reservation Management

Board 2 — Amendments, Cancellations, Refunds, Voids & Reissues

10 Backend Configuration Screens — Detailed SOW

Board 1 established the **creation and lifecycle of an order/reservation**. Board 2 should now govern everything that can happen **after the original transaction has been created**.

The screenshot displays the TICVAI software interface for 'AREA 12 - ORDER & RESERVATION MANAGEMENT'. The dashboard is divided into several sections:

- 12.2.1 Amendment & After-Sales Command Center:** Features KPI cards for Amendments Today (86), Cancellations (54), Refund Requests (63), and Refund Value (AED 124,530). It also includes a table for 'After-Sales Queue (Top 10)' and a 'View all requests' link.
- 12.2.2 Order Amendment Workspace:** Shows a detailed view of an order (ORD-202505-0012) with tabs for 'Info Change', 'Performance Change', 'Quantity Change', and 'Status Change'. It includes a 'Financial Preview' section.
- 12.2.3 Amendment Eligibility & Policy Rule Builder:** A complex interface for defining rules, including a 'Rule List' table and a 'Rule Details' section for 'Standard Date Change Rule'.
- 12.2.4 Cancellation & Partial Cancellation Policy Configuration:** A screen for configuring cancellation policies, including a 'Selected Rule Details' section.
- 12.2.5 Refund Policy & Refund Calculation Configuration:** A screen for configuring refund policies, including a 'Refund Rules' table and a 'Refund Calculation Example'.
- 12.2.6 Void, Reversal & Same-Day Correction Management:** A screen for managing voids and reversals, including a 'Void Rules' table and a 'Selected Rule Details' section.
- 12.2.7 Ticket Reissue & Fulfillment Regeneration:** A screen for managing ticket reissues, including a 'Reissue Requests' table and a 'View reissue history' link.
- 12.2.8 After-Sales Financial Settlement & Adjustment Workspace:** A screen for managing financial settlements, including a 'Financial Summary' section.
- 12.2.9 Approval, Exception & Service Recovery Management:** A screen for managing approvals and exceptions, including an 'Approval Queue' table.
- 12.2.10 Amendment History, Audit & After-Sales Analytics:** A screen for viewing amendment history and analytics, including a 'Transaction History' table and a 'Summary (This Period)' section.

The core architecture should be:

Existing Order → Requested Change → Policy & Eligibility Validation → Financial Impact → Capacity/Inventory Validation → Approval if Required → Execute Change → Refund/Collection if Required → Reissue/Update → Full Audit

A critical distinction for SoftLab:

Board 2 manages changes to an existing commercial transaction. Area 11 manages ticket upgrade/conversion logic. Area 10 calculates financial values. Board 2 orchestrates these services without duplicating them.

12.2.1 — Amendment & After-Sales Command Center

Purpose

Provide one operational workspace for all post-sale activities affecting confirmed orders and reservations.

KPI Cards

Display:

- Amendments Today
- Pending Amendments
- Cancellations
- Refund Requests
- Refund Value
- Voids
- Reissues
- Date/Time Changes
- Partial Cancellations
- Pending Approvals
- Failed Actions
- SLA Breaches

After-Sales Queue**Display:**

- Request ID
- Order Number
- Customer
- Request Type
- Product/Event
- Original Value
- Financial Impact
- Channel
- Requested By
- Approval Status
- Processing Status
- Created Time

Request Types**Support:**

- Order Amendment
- Reservation Amendment
- Date Change
- Timeslot Change
- Performance Change
- Quantity Change
- Attendee Change
- Cancellation
- Partial Cancellation
- Refund
- Void
- Reissue

Statuses

Examples:

Draft / Validation Required / Eligible / Approval Pending / Payment Required / Refund Pending / Processing / Completed / Rejected / Failed / Reversed

Filters

Filter by:

- Venue
- Event
- Product
- Request Type
- Channel
- Customer
- Agent
- Status
- Approval
- Date

Operational Alerts

Examples:

18 refund requests exceed SLA.

6 amendments require additional customer payment.

3 completed amendments failed ticket reissue.

AI Assistance

AI may summarize operational patterns:

“Refund requests increased 21% following yesterday's event cancellation.”

Acceptance Condition

Authorized users can monitor and manage all after-sales order activities from one centralized operational workspace.

12.2.2 — Order Amendment Workspace

Purpose

Provide agents with a controlled workspace for modifying an existing order without directly editing historical transaction records.

The original order must always remain reconstructable.

Order Context

Display:

- Order ID
- Customer
- Original Channel
- Venue
- Order Date
- Payment Status

- Fulfillment Status
- Total
- Tickets
- Current Reservation

Amendment Types

Allow authorized changes to:

- Visit Date
- Performance
- Timeslot
- Quantity
- Ticket Holder
- Customer Details
- Delivery Method
- Fulfillment Method
- Eligible Product Attributes
- Seat where applicable

Before / After Comparison

The screen should clearly display:

Original	Proposed
02 Sep 18:00	03 Sep 19:00
Standard	Standard
AED 250	AED 280
Section B	Section C

Validation

Before committing, validate:

- Product Rules
- Availability
- Capacity
- Seat Availability
- Customer Eligibility
- Amendment Policy
- Pricing
- Payment
- Waiver
- Credential Impact

Financial Preview

Display:

Original Value
New Value
Eligible Credit
Additional Collection
Refund Due
Fee
Tax Impact

Actions

- Save Draft
- Validate
- Calculate
- Submit for Approval
- Execute Amendment
- Cancel Request

Acceptance Condition

Authorized users can amend eligible order attributes through a controlled transaction while preserving the original order and validating all affected services.

12.2.3 — Amendment Eligibility & Policy Rule Builder

Purpose

Define when an order or reservation may be amended and which changes are permitted.

Policy Dimensions

Configure by:

- Tenant
- Venue
- Product
- Ticket Type
- Event
- Performance
- Channel
- Customer Segment
- Membership
- Order Status
- Ticket Status

Amendment Types

Enable/disable:

- Date Change
- Timeslot Change
- Performance Change
- Quantity Increase
- Quantity Reduction
- Seat Change

- Attendee Change
- Delivery Change
- Other permitted modifications

Time Restrictions**Examples:**

Date changes allowed until 24 hours before visit.

Timeslot changes allowed until 2 hours before entry.

No amendment after first admission.

Usage Restrictions**Rules can evaluate:**

- Unused
- Partially Used
- Fully Used
- Expired
- Cancelled
- Suspended

Frequency Limits**Configure:**

- Maximum Amendments per Order
- Maximum Amendments per Ticket
- Maximum Date Changes
- Cooling Period

Example:

Maximum two self-service changes per ticket.

Channel Rules**Example:****B2C:**

Date/time change only.

Call Center:

Date/time + attendee changes.

Supervisor:

Broader exception permissions.

Rule Priority

Support hierarchy and conflict detection where multiple amendment policies apply.

Acceptance Condition

TICVAI consistently determines whether a requested amendment is permitted based on centrally configured after-sales policies.

12.2.4 — Cancellation & Partial Cancellation Policy Configuration

Purpose

Configure whether an order, reservation, or selected order lines may be cancelled.

Cancellation Scope

Support:

- Entire Order
- Entire Reservation
- Individual Ticket
- Selected Order Lines
- Selected Quantity
- Add-On Only
- Group Member
- Package Component where permitted

Cancellation Conditions

Evaluate:

- Order Status
- Payment Status
- Ticket Status
- Usage
- Event Date
- Cancellation Window
- Product
- Channel
- Customer Segment

Cancellation Windows

Example:

More than 72 hours before event

Full cancellation permitted.

24-72 hours

Cancellation permitted with fee.

Less than 24 hours

Not permitted except supervisor exception.

Partial Cancellation

Example:

Order contains:

- 4 × Admission
- 4 × Fast Track
- 1 × Parking

Customer cancels:

1 Admission + associated Fast Track.

TICVAI must understand product dependencies.

Dependency Validation

If cancelling a parent product affects:

- Add-Ons
- Bundles
- Seats
- Parking
- Entitlements
- Discounts

the system should identify the consequences before execution.

Inventory Release

Cancellation should release eligible:

- Capacity
- Seats
- Inventory
- Reservations

according to policy.

Cancellation Reason Codes

Configure:

- Customer Request
- Event Cancelled
- Operational Issue
- Duplicate Order
- Weather
- Service Recovery
- Fraud Review
- Other

Acceptance Condition

Full and partial cancellations can be executed according to configurable policies while correctly handling dependencies and releasing applicable capacity.

12.2.5 — Refund Policy & Refund Calculation Configuration

Purpose

Define when a cancellation/amendment creates a refundable amount and how refund entitlement is determined.

Important architecture:

Board 2 owns refund eligibility and policy. Area 10 performs monetary calculation. The Payment Engine executes the actual refund.

Refund Methods

Support:

- Full Refund

- Partial Refund
- Percentage Refund
- Fixed Amount
- Pro-Rata Refund
- Original Value Less Fees
- Non-Refundable
- Wallet Credit
- Voucher/Credit Note
- Custom Governed Method

Refundable Components

Configure separately:

- Base Price
- Tax
- Booking Fee
- Service Fee
- Delivery Fee
- Add-On
- Discount
- Promotion
- Convenience Fee

Example

Original Order:

AED 500

Non-refundable booking fee:

AED 20

Cancellation fee:

AED 50

Eligible refund:

AED 430

Refund Destination

Depending on policy:

- Original Payment Method
- Wallet
- Voucher
- Credit Note
- Corporate Account
- Manual Financial Process

Multi-Payment Orders

Example:

AED 300 Credit Card

AED 100 Wallet

AED 100 Voucher

Refund policy determines how refundable value is distributed.

Financial Preview

Before execution show:

Original Paid

Already Refunded

Eligible Amount

Cancellation Fee

Non-Refundable Amount

Tax Adjustment

Final Refund

Acceptance Condition

TICVAI determines refund entitlement and financial treatment consistently without duplicating payment execution or central pricing logic.

12.2.6 — Void, Reversal & Same-Day Correction Management

Purpose

Separate genuine **void/correction operations** from normal customer cancellations and refunds.

This is important financially and operationally.

Transaction Types

Support:

- Order Void
- Payment Void Request
- Ticket Void
- Accidental Sale Reversal
- Duplicate Transaction Correction
- Same-Day Correction
- Failed Transaction Cleanup

Void vs Cancellation

TICVAI should explicitly distinguish:

Void

Transaction is reversed/corrected under configured conditions, often before settlement or final accounting treatment.

Cancellation

A valid commercial transaction existed and is subsequently cancelled.

Void Eligibility

Configure:

- Same Business Day Only
- Before Settlement
- Before Ticket Use

- Before Fiscal Closure
- Supervisor Required
- Specific Channels Only

Example**Cashier accidentally sells:**

10 Adult Tickets

instead of:

1 Adult Ticket.

Supervisor may use controlled correction rather than a standard customer refund flow.

Reason Codes**Mandatory reasons such as:**

- Operator Error
- Duplicate Sale
- Wrong Product
- Wrong Quantity
- Wrong Payment
- Technical Failure

Financial Integration**Void actions must synchronize with:**

- Payment Gateway
- POS
- Finance
- Fiscal/Tax Service where applicable

Security**High-risk void actions should require:**

- Role Permission
- Reason
- Supervisor Approval
- Optional Dual Authorization

Acceptance Condition

TICVAI can distinguish and securely process legitimate voids/reversals separately from normal cancellation/refund transactions.

12.2.7 — Ticket Reissue & Fulfillment Regeneration

Purpose

Manage ticket/media regeneration following an amendment, correction, loss, delivery failure, or other authorized event.

Reissue Reasons**Support:**

- Date Changed
- Timeslot Changed

- Seat Changed
- Attendee Changed
- Lost Ticket
- Damaged Credential
- Email Not Received
- Wallet Pass Issue
- Printing Error
- Credential Compromised
- Administrative Correction

Reissue Mode

Configure:

Reissue Same Entitlement

or

Reissue Updated Entitlement

Old Credential Treatment

Options:

- Immediately Invalidate
- Supersede
- Retain Until New Credential Activated
- Preserve where credential remains unchanged

Credential Types

Integrate with:

- QR
- Dynamic QR
- Barcode
- RFID
- NFC
- Wallet Pass
- Printed Ticket
- Wearable

Reissue Limits

Configure:

- Maximum Reissues
- Reissue Fee
- Free Reissue Count
- Supervisor Threshold

Security

For compromised credentials:

Old credential must become unusable before or atomically with the replacement becoming active.

Delivery

Allow:

- Email
- SMS/WhatsApp link
- Mobile App
- Wallet Update
- POS Print
- Box Office Collection

Acceptance Condition

Authorized reissues regenerate the appropriate ticket/credential while preventing duplicate valid credentials and preserving full history.

12.2.8 — After-Sales Financial Settlement & Adjustment Workspace

Purpose

Provide a consolidated view of the financial consequences of amendments, cancellations, refunds, exchanges and corrections.

This is not the payment engine; it is the **after-sales financial orchestration layer**.

Financial Summary**Display:**

- Original Order Value
- Current Order Value
- Additional Charge
- Refund Due
- Fees
- Tax Adjustment
- Credits
- Already Refunded
- Outstanding Balance
- Net Transaction Impact

Possible Outcomes**Customer Pays More****Example:**

Original = AED 250

New = AED 300

Additional Collection = **AED 50**

Customer Receives Refund

Original = AED 300

New = AED 250

Refund = **AED 50**, subject to policy.

No Financial Difference

AED 0.

Payment Status

Track:

- Collection Required
- Payment Pending
- Payment Complete
- Refund Pending
- Refund Complete
- Failed
- Reconciliation Required

Commit Control

A configurable policy determines whether the amendment occurs:

Before payment

or

Only after successful payment

For most paid upgrade/amendment scenarios, the safer default is:

Calculate → Collect → Commit Change.

Financial Documents**Trigger relevant:**

- Updated Receipt
- Invoice Adjustment
- Credit Note
- Refund Receipt

through the finance/document services.

Reconciliation**Identify cases such as:**

Amendment completed but additional payment failed.

Refund completed externally but order status not updated.

Acceptance Condition

Every after-sales operation has a reconciled financial outcome linked to the corresponding order change.

12.2.9 — Approval, Exception & Service Recovery Management

Purpose

Govern after-sales actions that fall outside normal policies or exceed financial/operational authority.

Approval Triggers**Examples:**

- Refund > AED 1,000
- Refund Outside Policy
- Expired Ticket Amendment
- Complimentary Reissue

- Cancellation After Deadline
- Manual Credit
- Fee Waiver
- Used Ticket Refund
- High-Value Void
- Bulk Cancellation

Approval Levels

Example:

Level 1 — Supervisor

≤ AED 500

Level 2 — Manager

AED 501–5,000

Level 3 — Finance

AED 5,000

Thresholds must be configurable.

Exception Request

Capture:

- Requested Action
- Customer
- Order
- Standard Policy Result
- Requested Exception
- Financial Impact
- Reason
- Supporting Documents
- Requestor

Service Recovery

Allow governed remedies:

- Complimentary Reissue
- Fee Waiver
- Partial Refund
- Voucher
- Wallet Credit
- Alternative Date
- Alternative Event
- Complimentary Add-On

AI Assistance

AI may recommend:

“Customer experienced two previous fulfillment failures. Current service-recovery policy allows fee waiver plus reissue.”

But AI must **not approve its own exception**.

Segregation of Duties**Where required:**

Requestor ≠ Approver

Acceptance Condition

Out-of-policy and high-risk after-sales actions are routed through configurable approval and service-recovery workflows with appropriate segregation of duties.

12.2.10 — Amendment History, Audit & After-Sales Analytics**Purpose**

Provide complete traceability and analytical visibility across all changes made after original order creation.

Transaction Chain**Visualize:****Original Order**

- Date Amendment
- Partial Cancellation
- Refund
- Ticket Reissue
- Final Order State

Audit Record**Capture:**

- Request ID
- Order ID
- Ticket ID
- Customer
- Action
- Before Value
- After Value
- Financial Impact
- Rule Applied
- Exception
- Approval
- User
- Channel
- Timestamp
- Result

Before/After Snapshot

Preserve snapshots for significant amendments.

Example:**Before**

Visit: 02 Sep 18:00
 Seat: B-12
 Value: AED 250

After

Visit: 03 Sep 19:00
 Seat: C-08
 Value: AED 280

Analytics

Provide:

- Amendment Rate
- Cancellation Rate
- Refund Rate
- Refund Value
- Average Refund
- Void Rate
- Reissue Rate
- Exception Rate
- Approval Rate
- Service-Recovery Cost

Analyze by:

- Venue
- Product
- Event
- Channel
- Agent
- Customer Segment
- Reason
- Period

AI Insights

Examples:

“Timeslot changes account for 42% of amendments for Product X.”

“Refund requests originating from OTA Channel Y are 31% above average.”

“Agent-level void rate exceeds the venue baseline.”

Fraud/Risk Indicators

Surface unusual patterns such as:

- Excessive Voids
- Repeated Manual Refunds
- Frequent Fee Waivers
- High Reissue Frequency
- Repeated Out-of-Policy Exceptions

These should feed the appropriate risk/security controls rather than automatically accusing users of misconduct.

Acceptance Condition

TICVAI can reconstruct and analyze every after-sales change from the original transaction through the final commercial, financial and credential state.

Board 2 — Final Screen Register

#	Backend Screen	Core Responsibility
12.2.1	Amendment & After-Sales Command Center	Central after-sales operations
12.2.2	Order Amendment Workspace	Controlled order modification
12.2.3	Amendment Eligibility & Policy Rule Builder	Amendment rules
12.2.4	Cancellation & Partial Cancellation Policy Configuration	Cancellation governance
12.2.5	Refund Policy & Refund Calculation Configuration	Refund eligibility/treatment
12.2.6	Void, Reversal & Same-Day Correction Management	Controlled transaction corrections
12.2.7	Ticket Reissue & Fulfillment Regeneration	Credential/ticket replacement
12.2.8	After-Sales Financial Settlement & Adjustment Workspace	Financial orchestration
12.2.9	Approval, Exception & Service Recovery Management	Exceptions and approvals
12.2.10	Amendment History, Audit & After-Sales Analytics	Audit and intelligence

Board 2 Architecture Boundary

I would freeze one particularly important rule for SoftLab:

Never overwrite the original order.

For example, if a customer changes:

2 September, 6:00 PM — AED 250

to:

3 September, 7:00 PM — AED 280

TICVAI should not simply replace the original values in the database. It should preserve the original commercial transaction and create an **auditable amendment transaction** recording the AED 30 difference, affected inventory/capacity, credential change, user/channel, policies used, and resulting state.

That principle will make finance reconciliation, customer service, fraud investigation, reporting, and auditing substantially more reliable.

Board 2 is therefore ready to freeze at 10 screens. The next step is the **High-Definition Board 2 design showing all 10 screens exactly as defined above.**

Area 12 — Order & Reservation Management

Board 3 — Payments, Order Structure, Reconciliation & Traceability

10 Backend Configuration Screens — Detailed SOW

Board 3 completes Area 12.

Board 1 manages **order/reservation creation and lifecycle**. Board 2 manages **what happens when an existing transaction changes**. Board 3 should manage the relationship between the order and its **payments, balances, split/merge structures, linked transactions, external references, reconciliation, and complete financial traceability**.

The architecture should be:

Order → Payment Obligations → Payment Transactions → Allocation → Balance → Settlement/Reconciliation → Related Orders → Financial Traceability → Audit

One architectural rule should be frozen from the beginning:

Area 12 does not become a payment gateway or accounting system. It orchestrates and records how payment transactions relate to TICVAI orders. Payment providers execute payments, while Finance/ERP owns accounting and settlement where applicable.

12.3.1 — Payment & Order Financial Command Center

Purpose

Provide operations and finance teams with a centralized view of the financial status of all TICVAI orders.

KPI Cards

Display:

- Gross Order Value
- Fully Paid Orders
- Partially Paid Orders
- Unpaid Orders
- Outstanding Balance
- Payments Today
- Failed Payments
- Pending Payments
- Refunds Pending
- Reconciliation Exceptions
- Unallocated Payments
- Settlement Variance

Financial Order Queue

Display:

- Order ID
- Customer
- Channel
- Order Value
- Amount Paid
- Refunded
- Outstanding
- Payment Methods
- Payment Status
- Settlement Status
- Reconciliation Status

Payment Statuses

Support:

- Not Required
- Unpaid
- Payment Initiated
- Authorized
- Partially Paid
- Paid
- Overpaid
- Partially Refunded

- Refunded
- Failed
- Reversed
- Reconciliation Required

Operational Alerts

Examples:

14 confirmed orders have outstanding balances.

AED 26,400 of payments are not currently allocated to orders.

7 payment transactions differ from gateway settlement records.

Filters

By:

- Venue
- Channel
- Payment Method
- Payment Provider
- Currency
- Order Status
- Payment Status
- Settlement Status
- Date
- Exception Type

AI Assistance

AI may summarize:

“Most unreconciled value today originates from OTA settlement batch OTA-0829.”

Acceptance Condition

Authorized users can monitor the complete payment and financial condition of orders across all TICVAI channels from one workspace.

12.3.2 — Order Payment Detail & Transaction Ledger

Purpose

Provide the complete payment history associated with an individual order.

Order Financial Header

Display:

- Order Number
- Customer
- Order Total
- Currency
- Paid
- Refunded
- Outstanding

- Credit Applied
- Payment Status
- Settlement Status

Transaction Ledger

Every financial transaction should be shown separately:

Transaction	Type	Method	Amount	Status
PAY-001	Payment	Visa	AED 300	Settled
PAY-002	Payment	Wallet	AED 100	Settled
REF-001	Refund	Visa	-AED 50	Completed

Transaction Types

Support:

- Authorization
- Capture
- Payment
- Deposit
- Additional Collection
- Refund
- Partial Refund
- Void
- Reversal
- Wallet Credit
- Voucher
- Credit Note
- Adjustment

Provider Information

Capture:

- Gateway
- Merchant
- Terminal
- Authorization Code
- Gateway Transaction ID
- Settlement Reference
- External Reference

Timeline

Example:

10:31 Payment Initiated
 10:31 Authorized
 10:32 Captured
 10:32 Allocated to Order
 10:33 Order Confirmed
 02 Sep — AED 50 Refunded

Immutable Financial History

Existing ledger transactions must not simply be edited or deleted.

Corrections should create a new linked transaction.

Acceptance Condition

Users can reconstruct every financial movement associated with an order from initial authorization through final refund/reversal.

12.3.3 — Multi-Payment, Split Tender & Payment Allocation Configuration

Purpose

Support orders paid using multiple payment methods and determine how each payment is allocated.

Supported Combinations

Examples:

Credit Card + Cash

Wallet + Credit Card

Voucher + Credit Card

Gift Card + Cash

Corporate Credit + Card

Split Tender Configuration

Configure by:

- Channel
- Venue
- Terminal
- Product
- Order Type
- Customer Type

Example

Order Total:

AED 1,000

Payment:

- Wallet — AED 250
- Voucher — AED 150
- Visa — AED 600

Remaining:

AED 0

Allocation Rules**Configure whether payment is allocated:**

- Order Level
- Order-Line Level
- Product Level
- Tax/Fee Component
- Specific Ticket
- Deposit

Restrictions**Examples:**

Voucher cannot pay booking fees.

Corporate credit applies only to eligible ticket products.

Wallet cannot be combined with specific promotions.

Refund Allocation

The original allocation must be retained so Board 2 can determine the correct refund destination.

Rounding

Any rounding should use the central financial/pricing rules rather than channel-specific logic.

Acceptance Condition

TICVAI supports controlled multi-method payments while maintaining an exact allocation of every monetary amount to the relevant order components.

12.3.4 — Deposit, Partial Payment & Outstanding Balance Management

Purpose

Support commercial scenarios where an order may be confirmed or reserved without full immediate payment.

Important for:

- Groups
- B2B
- Corporate Sales
- Schools
- Events
- Large Reservations

Payment Terms**Support:**

- Full Payment
- Fixed Deposit
- Percentage Deposit
- Staged Payment
- Balance Before Visit

- Balance by Fixed Date
- Credit Account
- Pay on Collection where permitted

Example**Group Order:****AED 25,000****Required Deposit:****20% = AED 5,000****Balance:****AED 20,000****Due:****15 September****Balance Tracking****Display:**

- Total
- Deposit Required
- Deposit Paid
- Remaining Balance
- Due Date
- Days Remaining
- Status

Payment Schedule**Support:****Deposit → Installment 1 → Installment 2 → Final Balance****Overdue Behavior****Configure:**

- Warning
- Grace Period
- Block Fulfillment
- Release Capacity
- Cancel Reservation
- Escalate
- Require Approval

Notifications**Trigger through central notification services:**

- Payment Reminder
- Due Soon
- Overdue
- Final Notice

Order Confirmation Policy**Examples:**

Reserve capacity after deposit.

Issue tickets only after full payment.

Acceptance Condition

TICVAI can manage deposits, staged payments and outstanding balances while correctly controlling reservation and fulfillment states.

12.3.5 — Order Split, Merge & Transaction Relationship Management

Purpose

Allow complex orders to be reorganized without destroying transaction history.

Split Order

Example:

Original family order:

6 Tickets — AED 1,200

Customer requests separate transactions:

Order A — 4 Tickets

Order B — 2 Tickets

Split By

Support:

- Ticket
- Attendee
- Product
- Order Line
- Payment Responsibility
- Department
- Corporate Cost Center

Merge Orders

Where policy permits:

Order A + Order B → Consolidated Order

Merge Validation

Check:

- Customer
- Currency
- Venue
- Legal Entity
- Tax Context
- Payment Status
- Product Compatibility

Relationship Types

Maintain:

- Parent Order
- Child Order
- Split From
- Merged Into
- Replacement Order
- Amended From
- Converted From
- Reissued From

Financial Allocation

When splitting an order, allocate:

- Base Price
- Discount
- Fees
- Tax
- Payments
- Refunds
- Credits

correctly across derived orders.

Original Order

Never erase the original relationship.

Example:

ORD-001 → Split → ORD-001-A + ORD-001-B

Acceptance Condition

Orders can be split or merged while maintaining accurate financial, customer, product, payment and historical relationships.

12.3.6 — Related Order & Transaction Relationship Explorer

Purpose

Provide a visual relationship map for complex transaction histories.

This becomes especially useful after amendments, upgrades, exchanges, reissues, splits and refunds.

Relationship Graph

Example:

Original Order ORD-1001

↓ Amendment

ORD-1001-A

↓ Ticket Upgrade

Upgrade TXN UPG-1042

↓ Additional Payment

PAY-2014

↓ Partial Cancellation

CAN-3021

↓ Refund

REF-4008**Relationship Types****Display:**

- Original
- Amendment
- Upgrade
- Conversion
- Exchange
- Split
- Merge
- Reissue
- Cancellation
- Refund
- Payment
- Chargeback where integrated
- External Transaction

Graph Interaction

Users can click any node to open the corresponding transaction.

Search**Search by:**

- Order
- Ticket
- Customer
- Payment
- Refund
- External Reference
- Partner Booking

AI Summary

AI can convert a complex graph into a concise operational explanation:

“The original order contained four tickets. Two were moved to a new performance, one was upgraded to VIP, and AED 120 was collected through an additional Visa payment.”

Acceptance Condition

Users can understand complex transaction chains without manually searching multiple systems or screens.

12.3.7 — External Payment, Partner & Settlement Reference Mapping

Purpose

Maintain the relationship between TICVAI transactions and external financial/channel references.

External Systems

Support references from:

- Payment Gateways
- Acquirers
- Banks
- POS Terminals
- B2B Partners
- Resellers
- OTAs
- ERP
- Finance Systems
- Wallet Providers

Mapping Fields

Capture:

- TICVAI Order ID
- TICVAI Payment ID
- Provider
- Merchant ID
- External Transaction ID
- Authorization Code
- Partner Order ID
- Settlement Batch
- Settlement Date
- ERP Reference
- Currency
- Amount

One-to-Many Relationships

One order may have:

- Multiple Payments
- Multiple Gateway Transactions
- Multiple Refunds
- Multiple Partner References

Import/Matching

Support reconciliation files/API feeds where available.

Unmatched Reference Queue

Example:

Gateway Transaction PG-984102 has no matching TICVAI payment.

or:

TICVAI payment PAY-0015 is missing from settlement batch.

Manual Mapping

Authorized users may manually link transactions with:

- Reason
- User
- Timestamp
- Approval where required

Acceptance Condition

TICVAI maintains traceable mappings between internal order/payment records and all relevant external transaction and settlement references.

12.3.8 — Payment Reconciliation & Exception Management

Purpose

Automatically compare TICVAI payment records with external payment and settlement records.

Reconciliation Sources

Compare:

TICVAI

vs.

- Payment Gateway
- Acquirer
- Bank
- POS
- OTA
- Reseller
- Wallet
- ERP

Match Criteria

Use:

- Transaction ID
- External Reference
- Amount
- Currency
- Date
- Merchant
- Order
- Authorization Code

Reconciliation Results

Statuses:

Matched**Partially Matched****Missing External****Missing TICVAI****Amount Mismatch****Currency Mismatch****Duplicate****Settlement Pending****Exception Queue****Example:**

Exception	TICVAI	External	Difference
Amount mismatch	AED 500	AED 480	AED 20
Missing settlement	AED 250	—	AED 250

Resolution Actions

- Match
- Remap
- Investigate
- Mark Pending
- Create Adjustment Request
- Escalate
- Send to Finance

AI Assistance**AI may identify patterns:**

“83% of today's settlement exceptions originate from one payment provider and appear related to delayed settlement files.”

Acceptance Condition

TICVAI can automatically reconcile internal payment transactions against external financial records and provide controlled exception-resolution workflows.

12.3.9 — Financial Traceability, Control & Audit Explorer

Purpose

Provide a complete financial audit trail across the order lifecycle.

Audit Chain**Trace:**

Product Price → Pricing Snapshot → Order → Payment → Amendment → Additional Collection → Cancellation → Refund → Settlement

Financial Snapshot

For every monetary transaction preserve:

- Amount
- Currency
- Price Version
- Tax
- Fee
- Discount
- Payment Method
- Provider
- User
- Channel
- Timestamp

Change Audit**Record:**

Who → Did What → Previous State → New State → Reason → Approval → Result

High-Risk Actions**Highlight:**

- Manual Payment Adjustment
- Manual Allocation
- Manual Reconciliation
- Void
- Manual Refund
- Fee Waiver
- Credit Override
- Manual Settlement Mapping

Segregation of Duties**Where configured:**

Creator ≠ Approver

and:

Cashier cannot approve own financial adjustment.

Audit Export**Authorized users can export controlled audit reports for:**

- Finance
- Internal Audit
- External Audit
- Compliance
- Management

Acceptance Condition

Every financial change affecting an order is attributable, reconstructable and linked to the responsible transaction, user, rule and approval.

12.3.10 — Order Financial Analytics & AI Reconciliation Intelligence

Purpose

Provide management-level analytics across order payment performance, balances, settlement and reconciliation.

KPI Analytics

Include:

- Gross Order Value
- Net Collected
- Outstanding Balance
- Collection Rate
- Refund Value
- Refund Rate
- Payment Failure Rate
- Reconciliation Rate
- Settlement Variance
- Average Payment Methods per Order
- Deposit Exposure
- Overdue Balance

Analyze By

- Venue
- Event
- Product
- Channel
- Payment Method
- Gateway
- Customer Segment
- B2B Partner
- Reseller
- OTA
- Currency
- Period

Payment Funnel

Visualize:

Payment Initiated

- Authorized
- Captured
- Order Confirmed
- Settled
- Reconciled

Outstanding Aging

Buckets:

- Current
- 1-7 Days
- 8-30 Days
- 31-60 Days
- 60+ Days

Provider Performance**Compare:**

- Approval Rate
- Failure Rate
- Settlement Delay
- Reconciliation Exceptions
- Refund Processing Time

AI Intelligence**AI can surface findings such as:**

“Gateway A's payment failure rate increased from 2.1% to 6.8% during the last 24 hours.”

“AED 182,000 of outstanding B2B balances become due within seven days.”

“OTA Partner B accounts for 61% of unmatched settlement transactions this week.”

Natural-Language Query**Authorized managers should be able to ask:**

“Show unreconciled payments above AED 5,000 from the last seven days.”

or:

“Which channel has the highest payment failure rate this month?”

Acceptance Condition

Management can analyze order-related financial performance and use AI-assisted intelligence to identify collection, payment and reconciliation issues.

Board 3 — Final Screen Register

#	Backend Screen	Core Responsibility
12.3.1	Payment & Order Financial Command Center	Financial operations overview
12.3.2	Order Payment Detail & Transaction Ledger	Complete payment history
12.3.3	Multi-Payment, Split Tender & Payment Allocation Configuration	Multiple payment methods
12.3.4	Deposit, Partial Payment & Outstanding Balance Management	Credit/deposit lifecycle
12.3.	Order Split, Merge & Transaction Relationship	Order restructuring

#	Backend Screen	Core Responsibility
5	Management	
12.3.6	Related Order & Transaction Relationship Explorer	End-to-end relationship graph
12.3.7	External Payment, Partner & Settlement Reference Mapping	External transaction mapping
12.3.8	Payment Reconciliation & Exception Management	Automated reconciliation
12.3.9	Financial Traceability, Control & Audit Explorer	Financial governance
12.3.10	Order Financial Analytics & AI Reconciliation Intelligence	Analytics and AI insights

Area 12 — Final Architecture

With Board 3, Area 12 is complete at 3 Boards / 30 screens:

Board 1 — Order & Reservation Lifecycle Creates and governs the core order/reservation.

Board 2 — Amendments, Cancellations, Refunds, Voids & Reissues

Controls what happens when the transaction changes after creation.

Board 3 — Payments, Order Structure, Reconciliation & Traceability

Controls how money and related transactions connect back to the order.

This gives us a very clean separation:

Board 1 = Create & Manage

Board 2 = Change & Correct

Board 3 = Pay, Relate & Reconcile

I would **freeze Area 12 with these 30 screens**. There is enough depth for enterprise ticketing without unnecessarily turning Order Management into Finance, Pricing, CRM, or Payment Gateway modules.

The next action is to **design Board 3 with all 10 screens exactly according to this SOW**.
