AI Configuration Assistant — Board 1: AI Guided Discovery & Configuration Blueprint

Module: AI Configuration Assistant
Board: 1 of 3
Screens: 10

Board Type: AI-Guided Discovery / Adaptive Q&A / Requirements Intelligence / Configuration Blueprint

Board Purpose

Board 1 is the **intelligence and discovery layer** of TICVAI's AI Configuration Assistant.

The objective is to allow an administrator to describe what they want to achieve in **normal business language**, without needing to understand TICVAI's module structure, configuration terminology, dependencies, or technical setup.

For example:

"I want to configure a new museum in Dubai."

The AI should not immediately start creating records. Instead, it should understand the administrator's objective and conduct an **adaptive configuration interview**.

Based on each answer, TICVAI determines what question should come next.

By the end of Board 1, TICVAI should have produced a structured, validated **Configuration Blueprint** containing everything required to proceed to Board 2.

Core Principle

This should **not be a generic chatbot**.

The AI conversation should be controlled by a TICVAI **Configuration Knowledge Graph / Blueprint Engine** containing:

- TICVAI modules
- Business capabilities

- Configuration objects
- **Dependencies**
- Required decisions
- Recommended decisions
- Optional decisions
- Conditional questions
- Validation rules
- Business templates
- Best practices

The AI provides the conversational intelligence; TICVAI's configuration model provides the deterministic control.

Screen 1 — AI Configuration Home & Start

Purpose

Provide one intelligent starting point for creating or modifying TICVAI configuration through AI.

The screen should immediately answer:

What would you like TICVAI to help you configure?

Header

AI Configuration Assistant

Subtitle:

Describe what you want to set up. TICVAI AI will guide you through the required decisions.

Main AI Input

Large conversational input:

- **What would you like to configure?**
- Example prompts:
 - “Set up a new museum.”
 - “Create ticket products for my water park.”
 - “Configure a new Christmas event.”
 - “Add VIP admission to an existing venue.”
 - “Set up timed admission for my aquarium.”
 - “Create a family ticket.”

Setup Mode

Allow:

- Create New Configuration
- Modify Existing Configuration
- Extend Existing Configuration
- Clone & Adapt Existing Setup

For Board 1, the primary design should emphasize **Create New**.

Suggested Starting Templates

Show intelligent cards such as:

- • Museum
- • Theme Park
- • Water Park
- • Zoo
- • Aquarium
- • Theatre
- • Stadium
- • Indoor Attraction
- • Family Entertainment Center
- • Festival
- • Conference
- • Temporary Event
- • Start from Scratch

Templates should accelerate discovery but **must not force the user into a rigid template**.

Recent AI Configuration Sessions

Show:

Session	Type	Progress	Last Activity	Status
Dubai Museum Setup	Museum	72%	Today	In Progress
Summer Festival	Event	100%	Yesterday	Blueprint Ready

Actions

[Start with AI](#) | [Use Template](#) | [Resume Session](#)

Screen 2 — Setup Type & Business Intent Discovery

Purpose

Understand **what the administrator is actually trying to accomplish** before asking detailed configuration questions.

This is the first AI interview screen.

AI Conversation

Example:

Administrator

We are opening a new museum in Dubai and need to configure it in TICVAI.

TICVAI AI

I can help configure the museum. Is this a completely new venue, or are you adding it under an existing organization?

Administrator:

- New venue under our existing company.

- AI:

Understood. Will the museum operate permanently or only for a defined period?

AI-Extracted Intent Panel

The right side should continuously translate the conversation into structured requirements.

Detected Setup

- Action: Create
- Object: Venue
- Venue Type: Museum
- Organization: Existing
- Location: Dubai
- Operation Type: Permanent
- Confidence: 96%

Intent Classification

AI should determine whether the user wants to:

- • Create Venue
- • Create Event
- • Create Product
- • Modify Existing Setup
- • Add New Sales Channel
- • Add Membership
- • Configure Access
- • Configure Pricing
- • Configure Promotion
- • Other supported configuration
- **Clarification**
 - When confidence is insufficient:
 - “When you say attraction, do you mean a permanent venue or a temporary event?”
 - The AI should **clarify rather than guess**.
- **Configuration Scope**
 - Show dynamically:

Likely Configuration Areas

- ✓ Venue
- ✓ Products
- ✓ Schedule
- ✓ Capacity
- ✓ Pricing
- ✓ Sales Channels
- ✓ Ticket Media
- ✓ Access

Possible:

- Promotions
- Membership
- Loyalty

Actions

Confirm Intent | Correct AI Understanding | Continue

Screen 3 — Venue & Business Model Discovery

Purpose

Understand how the business operates so TICVAI can determine which configuration branches are relevant.

AI Guided Questions

The AI should ask progressively rather than presenting a massive form.

Example:

- “How do customers visit your museum?”
- Options:
 - **General Admission**
 - Customers visit during operating hours.
 - **Timed Admission**
 - Customers reserve a specific time.
 - **Assigned Seating**
 - Customers select a specific seat.

Mixed

Different products use different admission models.

Venue Information

Capture as relevant:

- • Venue Name
- • Venue Type
- • Country
- • City
- • Time Zone
- • Currency
- • Operating Model
- • Permanent / Seasonal / Temporary
- • Indoor / Outdoor / Mixed
- • Number of Locations
- • Number of Attractions / Experiences
- **Business Model Discovery**
- AI should understand:
 - • General Admission
 - • Dated Admission
 - • Open-Dated Admission

- • Timeslot Admission
- • Assigned Seating
- • Multi-Day Admission
- • Membership
- • Subscription
- • Pass
- • Attraction / Ride-Based
- • Mixed Model
- **Conditional Logic**
- If:
- **Venue = Theatre**
- AI should prioritize:
 - • Performances
 - • Seat Map
 - • Sections
 - • Price Categories
 - • Show Schedule
- If:
- **Venue = Museum + Timeslot**
- AI should prioritize:
 - • Operating Calendar
 - • Timeslots
 - • Capacity
 - • Arrival Tolerance
 - • Admission Validation
- **Live Understanding Panel**
- Show:
- **Business Model**
- Museum
- **Admission**
- Timed Entry
- **Operating Model**
- Permanent
- **Primary Currency**
- AED
- **Configuration Confidence**
- 92%

Actions

[Confirm](#) | [Edit Understanding](#) | [Continue](#)

Screen 4 — Guided Question & Answer Workspace

Purpose

Provide the main adaptive AI interview workspace.

This is the **core screen of Board 1**.

It should feel conversational but remain structured and controlled.

Main Layout

Left: Configuration Progress

Center: AI Conversation

Right: AI Understanding / Decisions

Configuration Progress

Example:

Discovery Progress — 42%

- ✓ Business Context
- ✓ Venue Model
- Admission Model
- Products
- Schedule
- Capacity
- Pricing
- Channels
- Fulfillment
- Access

AI Conversation

Example:

TICVAI AI

You selected timed admission. How long should each admission timeslot be?

Administrator:

- 30 minutes.
- AI:
- How many visitors can enter during each 30-minute slot?
- Administrator:
- 150.
- AI:
- Should customers be allowed to arrive after their reserved time?
- Administrator:
- Yes, up to 15 minutes late.
- AI understands:
- **Timeslot Duration:** 30 min
- Capacity:** 150
- Late Arrival Tolerance:** 15 min
- **Answer Methods**
- Support:

- • Free Text
- • Single Choice
- • Multi-Select
- • Numeric
- • Date
- • Time
- • Yes / No
- • AI Suggested Answer
- • Use Recommended Default

- **Why Are You Asking?**

- Every significant question should allow:

- **Why is this needed?**

- AI explains:

“Timeslot capacity determines how many tickets TICVAI can sell for each admission period and prevents overselling.”

Skip Logic

Questions should disappear when irrelevant.

Example:

- If:
- **Assigned Seating = No**
- then do not ask:

“Which seat map should be used?”

Actions

Answer | Skip Optional | Use Recommendation | Go Back | Save & Continue Later

Screen 5 — Product & Admission Model Discovery

Purpose

Determine what the venue sells and how each product provides admission or entitlement.

AI Question

“What types of tickets or products do you plan to sell?”

Product Discovery

Examples:

- • Adult
- • Child
- • Senior
- • Student
- • Family
- • VIP
- • Group
- • Corporate

- • Membership
- • Annual Pass
- • Add-On
- • Experience
- • Guided Tour
- **AI Product Suggestions**
- Based on venue type:

Recommended for Museum

- ✓ Adult Admission
- ✓ Child Admission
- ✓ Family Admission

Suggested:

- • Guided Tour
- • Annual Membership
- • VIP Experience

The administrator can accept, reject, or modify recommendations.

Product Detail Discovery

For each product, determine:

- • Product Type
- • Admission Model
- • Validity
- • Customer Eligibility
- • Entitlement
- • Capacity Relationship
- • Schedule Relationship
- • Access Requirement

Example

Adult Admission

Admission:

- **Timeslot**
- Validity:
- **Selected Visit Date**
- Entitlement:
- **Museum Entry**
- Capacity:
- **Shared Museum Admission Pool**
- **Product Relationship Discovery**
- Ask where necessary:
- “Do Adult and Child tickets consume the same admission capacity?”
- “Can the Guided Tour be purchased independently, or does it require admission?”
- **AI Dependency Recognition**
- AI identifies:

- **Guided Tour**
- Requires:
- **Admission Ticket**
- Therefore:

Guided Tour → Requires → Museum Admission

Actions

Add Product | Accept Recommendation | Remove | Continue

Screen 6 — Operational Requirement Discovery

Purpose

Understand the operational rules needed to deliver the configured products.

Discovery Areas

AI determines which operational areas are relevant:

- • Operating Calendar
- • Opening Hours
- • Timeslots
- • Performance Schedule
- • Capacity
- • Resource Requirements
- • Seating
- • Entry / Exit
- • Re-entry
- • Access Control
- • Reservation Window
- • Blackout Dates
- • Special Days

• Example Conversation

- AI:
- “What are the museum's normal operating hours?”
- Administrator:

Sunday to Thursday 10 AM–8 PM and Friday/Saturday 10 AM–10 PM.

AI converts this into structured schedule rules.

Capacity Discovery

AI asks:

- “Is the 150-person capacity per timeslot shared by all admission products?”
- Options:
 - • Shared Capacity
 - • Separate Capacity by Product
 - • Separate Capacity by Channel
 - • More Complex Setup

- **Access Discovery**

- Example:
- “Will tickets be scanned at the entrance?”

- **Yes**

- AI then asks:
- “Should a ticket allow re-entry after the visitor exits?”

- **Operational Requirements Panel**

- Example:
- **Schedule**
- Sun–Thu: 10:00–20:00
- Fri–Sat: 10:00–22:00

- **Timeslot**

- 30 minutes

- **Capacity**

- 150 / timeslot

- **Entry**

- QR Validation

- **Re-entry**

- No

Actions

Confirm Operations | Add Requirement | Continue

Screen 7 — Commercial Requirement Discovery

Purpose

Understand how the venue intends to sell and commercially manage its products without actually configuring pricing yet.

AI Discovery Areas

- Sales Channels
- Currency
- Pricing Approach
- Taxes
- Fees
- Promotions
- Bundles
- Group Pricing
- Dynamic Pricing
- Reseller Sales
- Membership Discounts
- Upselling / Cross-Selling

Sales Channel Question

AI:

- “Where should customers be able to purchase tickets?”
- Options:
 - ✓ B2C Website
 - ✓ POS
 - ☐ Mobile App
 - ☐ B2B Reseller
 - ☐ Kiosk
 - ☐ Call Center
 - ☐ OTA / External Partner
- **Pricing Discovery**
- AI:
 - “Will ticket prices remain fixed, or do you want prices to vary?”
 - Options:
 - • Fixed Pricing
 - • Date-Based
 - • Day-of-Week
 - • Seasonal
 - • Demand-Based / Dynamic
 - • Different by Channel
 - • Not Decided

Example

Administrator:

Adult is AED 120 and Child is AED 80, but weekends should be more expensive.

AI extracts:

Adult Base: AED 120

Child Base: AED 80

Weekend Differential: Required

Pricing Model: Calendar / Rule Based

AI does **not** build the pricing rules yet. That happens in Board 2.

Commercial Opportunities

AI can recommend:

- “Since you offer Adult and Child admission, would you like to consider a Family Package?”
- Classify as:

Recommended — Optional

Actions

Confirm Commercial Model | Accept Recommendation | Continue

Screen 8 — Required, Recommended & Optional Decisions

Purpose

Prevent the administrator from forgetting important configuration while also preventing unnecessary questions from blocking setup.

This screen is fundamental to making the AI genuinely useful.

Decision Classification

Every configuration decision should be classified as:

- ☒ **Required**
 - Cannot proceed without resolution.
 - Example:
 - Admission Model
 - Currency
 - Capacity
 - Product Validity

☐ **Recommended**

TICVAI recommends configuring it, but setup can continue.

Example:

- ☐ **Optional**
 - Business choice.
 - Example:
 - Refund Policy
 - Late Arrival Policy
 - Family Package
 - Capacity Warning
 - Membership
 - Loyalty
 - Dynamic Pricing
 - Cross-Sell

• **Decision Center**

Decision	Area	Classification	Status	AI Recommendation
Capacity	Admission	Required	Complete	150
Refund Policy	Service	Recommended	Missing	Configure
Membership	Commercial	Optional	Skipped	—
Late Arrival	Access	Recommended	Complete	15 min

• **AI Recommendation**

- Example:

Refund Policy is not configured.

Similar timed-admission setups normally require a decision on whether customers may refund or reschedule before the visit.

Options:

- **Configure Now**
- **Use Recommended Policy**
- **Decide Later**

- **Required Rule**
- For Required decisions:

Decide Later should not allow final blueprint readiness.

Actions

Resolve | Accept AI Recommendation | Mark Optional as Not Required

Screen 9 — Missing Information & Clarification Center

Purpose

Allow AI to identify incomplete, contradictory, ambiguous, or logically inconsistent requirements before producing the final blueprint.

Header KPIs

- Required Missing
- Clarifications Needed
- Conflicts
- Warnings
- Recommendations

Issue Types

Missing

Adult ticket price has not been provided.

Ambiguous

You said “children enter free,” but a Child Ticket product was also created.

Conflict

Venue closes at 20:00, but the final 30-minute timeslot is configured for 20:00.

Dependency

Guided Tour requires Museum Admission, but independent purchase was also selected.

Recommendation

Capacity has been configured, but no capacity warning threshold has been selected.

Issue Detail

Show:

Issue

Last timeslot conflicts with operating hours.

Detected From

Operating Hours: 10:00–20:00

Timeslot Start: 20:00

Duration: 30 minutes

AI Resolution

"I recommend changing the final admission slot to 19:30. Would you like me to update the blueprint?"

Accept Recommendation

Change Manually

Explain More

Conflict Severity

- Critical
- High
- Medium
- Low
- Recommendation

Readiness Indicator

Configuration Discovery Readiness: 87%

2 required decisions must be resolved before the blueprint can be finalized.

Actions

Resolve All | Ask AI | Accept Recommendation | Return to Question

Screen 10 — Configuration Blueprint & Dependency Map

Purpose

Convert the entire AI conversation into a structured configuration blueprint that can be reviewed before moving to Board 2.

This is the **final output of Board 1**.

Nothing should yet be created in production.

Blueprint Header

Dubai Museum — Initial Configuration

Status:

- **Blueprint Ready**
- AI Confidence:
- **97%**
- Discovery Completion:
- **100% Required / 92% Overall**
- **Blueprint Summary**
- **Venue**

Dubai Museum

Type: Museum

Currency: AED

Time Zone: UAE

Operating Model: Permanent

Products

Adult Admission

AED 120

Child Admission

AED 80

Family Admission

Recommended / Pending Decision

Admission

Timeslot Based

30-Minute Slots

150 Visitors / Slot

Schedule

Sun–Thu: 10:00–20:00

Fri–Sat: 10:00–22:00

Channels

B2C ✓

POS ✓

Access

Dynamic QR

Single Entry

No Re-entry

Dependency Map

The design should visually show:

- **Venue**
↓
- **Operating Calendar**
↓
- **Ticket Products**
↓
- **Schedule / Timeslots**
↓
- **Capacity Pool**
↓
- **Pricing**
↓
- **Sales Channels**
↓
- **Ticket Media**
↓

- **Access Rules**
- and relevant cross-links.

Module Mapping

AI should also translate the blueprint into TICVAI ownership.

Requirement	TICVAI Module	Object to Configure
Adult Admission	Ticketing	Ticket Product
30-min Admission	Ticketing/Event	Timeslot
150 Visitors	Capacity	Capacity Pool
AED 120	Pricing	Pricing Profile
B2C	Sales Channel	Channel Association
Dynamic QR	Ticket Media	Media Template
Single Entry	Access Control	Admission Rule

This is extremely important because it shows **how the AI understands TICVAI internally**.

Dependency Status

Each node:

- Ready
- Missing
- Warning
- Optional
- Conflict

AI Summary

I have enough information to build your proposed TICVAI configuration.

I will prepare 1 venue, 3 ticket products, operating schedules, timeslot rules, a shared capacity pool, pricing requirements, B2C/POS channel associations, dynamic QR ticket media, and admission rules.

Final Actions

Review Blueprint

Modify with AI

Save Blueprint

Primary CTA

Continue to AI Configuration Builder →

This moves the configuration to **Board 2**.

Critical Adaptive Questioning Logic

Soft Labs should not implement Board 1 as a fixed questionnaire.

For example:

- **User selects Open-Dated Admission**
- AI asks about:

- **Validity Period → Activation → Expiry → Blackout Dates**
- It should **not** ask about timeslot duration.
- **User selects Timeslot Admission**
- AI asks:
- **Operating Schedule → Slot Duration → Capacity → Reservation Window → Arrival Tolerance**
- **User selects Assigned Seating**
- AI asks:
- **Seat Map → Sections → Seat Categories → Holds → Accessibility → Price Categories**
- **User selects Membership**
- AI asks:

Membership Duration → Renewal → Benefits → Usage Limits → Account Holder → Entitlements

Therefore the interview tree must dynamically change based on previous decisions.

Configuration Knowledge Graph

I strongly recommend that this be explicitly included in the Soft Labs architecture.

Conceptually:

- **Venue Type**
- → supports →
- **Business Models**
- → require →
- **Configuration Capabilities**
- → contain →
- **Required / Recommended / Optional Decisions**
- → create →
- **TICVAI Configuration Objects**
- For example:
- **Museum**
-
- Timeslot Admission
-
- Requires:
 - • Operating Calendar
 - • Timeslot Duration
 - • Capacity
 - • Product
 - • Pricing
 - • Ticket Media
 - • Access Rule
-
- May Recommend:
 - • Refund Policy
 - • Rescheduling

- • Family Product
- • Membership
- • Upsell

This gives the AI **controlled intelligence** rather than allowing the LLM to invent configuration logic.

AI Memory Within the Configuration Session

The assistant must maintain context throughout the discovery.

If the administrator already said:

- “The museum capacity is 150 visitors every 30 minutes.”
- the AI must not later ask:
 - “What is your timeslot capacity?”
 - Instead, it should use:
 - **Capacity = 150**
 - and potentially ask only a dependency question:

“Should Adult, Child, and Family tickets all consume this same 150-person capacity?”

AI Confidence & Assumptions

AI should distinguish between:

- **Confirmed**
 - Explicitly provided by administrator.

AI Recommended

Suggested based on TICVAI configuration logic.

Inferred

AI interpreted from conversation but needs confirmation where material.

Unknown

Information still required.

For example:

- **Currency: AED — Confirmed**
- **Venue Type: Museum — Confirmed**
- **Family Ticket: Recommended**

Refund Policy: Unknown

This prevents AI assumptions from silently becoming production configuration.

Board 1 Boundary

Board 1 must **discover and structure**.

It must not yet:

- • Create ticket products
- • Create pricing
- • Create schedules

- • Create capacity
 - • Create access rules
 - • Publish anything
 - • Change production configuration
 - Those actions belong to Boards 2 and 3.
 - The clean separation is:
 - **Board 1 — Understand**
 - →
 - **Board 2 — Build & Validate**
 - →
 - **Board 3 — Approve & Execute**
-

Board 1 — Final Screen Map

AI Guided Discovery & Configuration Blueprint

1. **AI Configuration Home & Start**
2. **Setup Type & Business Intent Discovery**
3. **Venue & Business Model Discovery**
4. **Guided Question & Answer Workspace**
5. **Product & Admission Model Discovery**
6. **Operational Requirement Discovery**
7. **Commercial Requirement Discovery**
8. **Required, Recommended & Optional Decisions**
9. **Missing Information & Clarification Center**
- 10. Configuration Blueprint & Dependency Map**

This Board should make the administrator feel that **TICVAI understands their business rather than forcing them to understand TICVAI**. That is the key differentiator I would protect throughout the design.

AI Configuration Assistant — Board 2: AI Configuration Builder & Validation

Module: AI Configuration Assistant
Board: 2 of 3
Screens: 10
Board Type: AI Configuration Generation / Cross-Module Builder / Validation / Simulation / Impact Analysis

Board Purpose

Board 2 takes the **approved Configuration Blueprint produced by Board 1** and converts it into a complete, structured **proposed TICVAI configuration**.

The key difference is:

- **Board 1 asks:**
- “What does the business need?”
- **Board 2 asks:**

“Exactly how should TICVAI be configured to deliver it?”

The AI should translate business requirements into the appropriate configuration objects across TICVAI modules while respecting the ownership and rules of each module.

For example, Board 1 may conclude:

Museum + Adult/Child tickets + 30-minute timeslots + 150 visitors per slot + weekday/weekend pricing + B2C/POS + Dynamic QR + no re-entry.

Board 2 converts this into proposed objects such as:

Venue Configuration

→ **Ticket Products**

→ **Validity Rules**

→ **Operating Calendar**

→ **Timeslot Templates**

- **Capacity Pools**
- **Pricing Profiles**
- **Channel Associations**
- **Ticket Media Template**
- **Access Rules**

However, **Board 2** still does not directly publish the configuration into production.

Its job is:

- **Build → Validate → Simulate → Detect Impact → Prepare for Approval**
- Execution belongs to Board 3.

Screen 1 — AI Configuration Build Command Center

Purpose

Provide a central workspace showing how the Board 1 blueprint is being converted into actual TICVAI configuration objects.

Header

Dubai Museum — AI Configuration Build

- → Validation

- **AI Build Activity**

- Example:
- ✓ Created proposed Adult Admission product
- ✓ Created Child Admission product
- ✓ Created shared capacity pool
- ✓ Generated weekday pricing profile
- ⚠ Refund policy requires confirmation
- ● Final Friday timeslot exceeds closing time

Actions

Continue Building | Ask AI | Review Issues | Rebuild Configuration

Screen 2 — Venue & Organization Configuration

Purpose

Convert the discovered business structure into the actual organizational and venue configuration required by TICVAI.

Blueprint Source

Display:

Board 1 Requirement

New permanent museum in Dubai under existing organization.

Proposed Configuration

Organization

- Organization
- Legal Entity
- Business Unit
- Tenant
- Default Currency
- Default Language
- Time Zone

Venue

- Venue Name
- Venue Code
- Venue Type
- Country
- City
- Time Zone
- Currency
- Operating Model
- Status

Example

Venue Name

Dubai Museum

Venue Code

DXB-MUS-01

Venue Type

Museum

Currency

AED

Time Zone

Asia/Dubai

AI Generated Values

AI-generated fields should be visibly marked:

- **AI Suggested**
- For example:
- Venue Code:
- DXB-MUS-01
- The administrator can:
- **Accept | Modify**
- **Structural Relationships**
- Show:
- **Organization**

- **Business Unit**

- **Venue**

- **Sales / Operational Configuration**

- **Validation**

- Check:

- ✓ Organization exists
- ✓ Currency supported
- ✓ Time zone valid
- ✓ Venue code unique
- ✓ Required fields complete

Actions

Accept All | Modify | Ask AI | Mark Ready

Screen 3 — Product Configuration Assistant

Purpose

Convert Board 1 product requirements into actual proposed TICVAI ticket products and associated product rules.

This screen should connect directly to the existing **Ticketing module architecture**, not create a separate AI product model.

Product List

Example:

1. • Adult Admission
2. • Child Admission
3. • Family Admission — AI Recommended

- **Product Configuration**

- For each product:

- **Identity**

- • Product Name
- • Product Code
- • Product Type
- • Category
- • Status
- **Admission Model**
 - • Open Dated
 - • Dated
 - • Timeslot
 - • Assigned Seating
 - • Multi-Day
 - • Pass
 - • Other supported models
- **Adult Admission Example**
- **Product Type**
- Admission
- **Admission Model**
- Timeslot
- **Validity**
- Selected Visit Date + Timeslot
- **Entitlement**
- Museum Entry
- **Capacity**
- Shared Museum Capacity

Eligibility

Adult:

- **Age 13+**
- Child:
- **Age 3–12**
- If the age rules were not explicitly supplied, AI must show:
- **AI Recommendation — Confirmation Required**
- rather than silently inventing them.
- **Product Relationships**
- Visualize:
- **Adult Admission**
- → Museum Entry
- **Child Admission**
- → Museum Entry
- **Guided Tour**
- → Requires Museum Admission
- **AI Recommendation**
- Example:

“Your Adult and Child products use identical admission rules. I recommend using a shared validity template to simplify maintenance.”

Actions

Accept Product | Edit | Duplicate | Add Product | Remove Recommendation

Screen 4 — Schedule, Capacity & Availability Configuration

Purpose

Translate operating requirements into actual schedules, timeslots, reservation windows, and capacity structures.

Operating Calendar

Example:

- **Sunday–Thursday**
 - 10:00–20:00
- **Friday–Saturday**
 - 10:00–22:00
- **Timeslot Template**
- **Duration**
 - 30 minutes
- **AI Generated Slots**
 - Example:
 - 10:00
 - 10:30
 - 11:00
 - 11:30
 - ...
 - 19:30
- **Capacity**
- **Shared Capacity Pool**
 - Museum General Admission
- **Capacity per Slot**
 - 150
- **Product Consumption**
 - Adult Admission:
 - **1 capacity unit**
 - Child Admission:
 - **1 capacity unit**
 - Family Admission:

If family product represents multiple visitors, AI must determine the correct capacity consumption.

Example:

- **Family 2+2 → 4 capacity units**
- **Reservation Window**
- Configure:
 - • Sales Open Date
 - • Advance Booking

- • Booking Cutoff
- • Same-Day Booking
- • Late Booking
- • Holds
- **Exception Calendar**
- AI should identify:
 - • Public Holidays
 - • Special Events
 - • Closed Dates
 - • Extended Hours
 - • Maintenance Closures

but not automatically assume actual dates unless supplied/configured.

Visual Calendar

Show generated operating schedule and capacity by day.

Validation

Example:

-  **Conflict**
- Friday closing:
- 22:00
- Final generated slot:
- 22:00–22:30
- AI recommendation:

“Move the final admission slot to 21:30.”

Actions

Accept Recommendation | Edit Schedule | Edit Capacity | Validate

Screen 5 — Pricing & Commercial Configuration

Purpose

Convert commercial requirements into proposed pricing, tax, fee, and commercial rules using TICVAI's existing Pricing architecture.

Product Pricing

Example:

Product	Weekday	Weekend
Adult	AED 120	AED 140
Child	AED 80	AED 95
Family	—	—

- **Pricing Profile**
- AI creates:
- **Museum Standard Pricing**

- Rules:
- **Sunday–Thursday**
- Weekday Price
- **Friday–Saturday**
- Weekend Price
- **Pricing Rule Structure**
- Show:

Product

-

Date / Day Rule

-

Channel

-

Customer Eligibility

=

Effective Price

Taxes & Fees

Configure:

- • Tax Profile
- • Tax Inclusive / Exclusive
- • Service Fee
- • Booking Fee
- • Channel Fee

- **AI Recommendation**

- Example:

“You requested higher weekend pricing. I have proposed a Day-of-Week pricing rule rather than creating duplicate ticket products.”

This is exactly the type of intelligence TICVAI AI should provide.

Dynamic Pricing

If Board 1 selected Dynamic Pricing:

AI should map to the existing **Dynamic Pricing module**, not recreate its rules here.

Show:

- **Dynamic Pricing Configuration Required →**
- **Price Simulation**
- Example:
- **Adult / Saturday / B2C**
- Base:
- AED 120
- Weekend Rule:
 - • AED 20
- Final:

AED 140

Actions

Accept Pricing | Modify | Simulate Price | Open Advanced Pricing

Screen 6 — Promotion, Bundle & Upsell Configuration**Purpose**

Convert identified commercial opportunities into proposed promotion, package, bundle, upsell, and cross-sell configuration.

This screen should only become prominent when relevant.

AI Opportunities

Example:

- **Family Package**
- **AI Recommended**
- Reason:

Adult and Child products exist and family attendance is expected.

Suggested:

- **2 Adults + 2 Children**
- **Bundle Builder**
- Example:
- **Family Museum Package**
- Contains:
- 2 × Adult Admission
- 2 × Child Admission
- **Pricing**
- Standard combined price:
- AED 400
- Suggested Package:
- AED 360
- Saving:

AED 40 / 10%

The AI should not automatically decide commercial discounts without administrator confirmation.

Upsell

Example:

- When customer selects:
- **Adult Admission**
- Recommend:
- **Guided Tour**
- **Cross-Sell**
- Example:
- After ticket selection:
- **Annual Membership**

- **Promotion Recommendations**

- AI may suggest:
 - • Family Package
 - • Early Booking
 - • Off-Peak
 - • Membership Upgrade
 - • Group Offer

- **Classification**

- Every suggestion:

- **Business Requested**

or

- **AI Recommended**

Actions

Accept | Modify | Reject | Add Commercial Rule

Screen 7 — Seating, Access & Operational Configuration

Purpose

Configure the operational rules required to fulfill and validate the products.

The screen should adapt depending on venue type.

For the museum example, seating is irrelevant and should not consume UI attention.

Applicable Configuration

Seating

Not Required

Access Control

Required

Resources

Optional

Ticket Media

Proposed:

- **Dynamic QR**
- **Access Rule**
- **Museum General Admission**
- Configure:
 - • Entry Count
 - • Exit
 - • Re-entry
 - • Validity
 - • Early Entry Tolerance
 - • Late Entry Tolerance
 - • Gate / Zone

- • Anti-Passback
- • Override Permission

Example

Entry

1

Re-entry

No

Early Arrival

15 minutes

Late Arrival

15 minutes

Gate Mapping

Where known:

- **Main Entrance**
 - → Museum Admission Rule
 - If physical gates are not yet configured:
 - ⚠ **Gate assignment pending — may be completed later.**
- **Assigned Seating Branch**
 - If venue = Theatre:
 - this same screen should instead prioritize:
- **Seat Map → Sections → Categories → Holds → Accessibility → Access**
- **Resource Branch**
 - If product requires a resource:

Product → Resource Type → Availability → Allocation

Actions

Accept Operations | Modify Access | Configure Advanced Rules

Screen 8 — Channel, Media & Fulfillment Configuration

Purpose

Determine how the proposed products are sold, delivered, and fulfilled across TICVAI channels.

Sales Channels

Example:

- ✓ B2C Website
 - ✓ POS
- Not Selected:
- ○ B2B
 - Reseller
 - Kiosk
 - OTA
 - Mobile App

• Channel Association Matrix

Product	B2C	POS	B2B	Kiosk
Adult	✓	✓	—	—
Child	✓	✓	—	—
Family	✓	✓	—	—

• Ticket Media

- Configure:

• Digital Ticket

- Dynamic QR

• POS

- Printed QR / Digital

• Delivery

- Options:

- • Email
- • Download
- • Mobile
- • Wallet
- • Print
- • Other supported methods

• Fulfillment Rules

- Example:

• B2C

- Payment Completed

- Generate Ticket

- Dynamic QR

- Email + Download

• Channel Dependency Validation

- Example:

B2C is enabled but no online payment configuration is associated.

Classification:

Required Dependency

AI should identify it, not silently create payment-provider configuration.

Actions

Accept Channels | Modify | Resolve Dependencies | Preview Fulfillment

Screen 9 — Cross-Module Conflict & Dependency Validation

Purpose

Perform a comprehensive validation of the proposed configuration across all TICVAI modules before it is presented for approval.

This should be one of the most important screens in Board 2.

Header KPIs

- Configuration Objects
- Passed
- Warnings
- Conflicts
- Missing Dependencies
- Approval Requirements

Validation Categories

Structural

✓ Venue exists in organization hierarchy.

Product

✓ Every ticket product has an entitlement.

Schedule

● Final slot exceeds operating hours.

Capacity

✓ Products linked to capacity pool.

Pricing

✓ Every active product has valid pricing.

Channel

● B2C requires payment configuration.

Media

✓ Dynamic QR supported.

Access

✓ Every admission entitlement has an access rule.

Dependency Graph

Visualize:

- **Product**
- → Schedule
- → Capacity
- → Pricing
- → Channel
- → Payment
- → Ticket Media

- → Access
- Use status indicators:
 -  Valid
 -  Warning
 -  Conflict
 -  Optional
- **Issue Detail**
 - Example:
 - **Missing Payment Dependency**
 - **Affected**
 - B2C Website

Reason

B2C ticket purchase requires an online payment configuration.

AI Recommendation

“No payment provider was selected during discovery. Would you like to link an existing payment configuration or return to configuration?”

Actions:

- **Link Existing**
- **Configure Later**
- **Ask AI**
- **Auto-Fix**
- For safe changes, AI can propose:

Apply Suggested Fix

But the user should see exactly what will change.

Actions

Resolve Issues | Apply Safe Fixes | Revalidate

Screen 10 — Configuration Preview & Impact Analysis

Purpose

Present the complete proposed configuration in business and technical terms before moving to approval and execution in Board 3.

This is the final output of Board 2.

Header

Dubai Museum — Proposed TICVAI Configuration

Status:

- **Ready for Approval**
- Configuration Readiness:
 - **100% Required**
 - Warnings:

- **2 Non-Blocking**
- **Configuration Summary**
- **Organization & Venue**
- 1 Venue

Ticketing

3 Products
3 Entitlements
2 Validity Templates

Schedule

2 Operating Patterns
24 Daily Timeslot Rules

Capacity

1 Shared Capacity Pool

Pricing

3 Pricing Profiles
2 Day-of-Week Rules

Channels

B2C
POS

Media

1 Dynamic QR Template

Access

1 Admission Policy

Proposed Object List

Object	Module	Action	Source	Status
Dubai Museum	Venue	Create	Business Requirement	Ready
Adult Admission	Ticketing	Create	Business Requirement	Ready
Child Admission	Ticketing	Create	Business Requirement	Ready
Family Admission	Ticketing	Create	AI Recommendation	Ready
Museum Capacity	Capacity	Create	Derived	Ready
Weekend Pricing	Pricing	Create	Business Requirement	Ready

Impact Analysis

Because Board 2 must also support **modifying existing configurations**, the screen should show impact.

Example:

- Changing weekend pricing will affect:
 - **2 Products**
 - **1 Pricing Profile**
 - **B2C**

- **POS**
- **No issued tickets affected**
- **For New Configuration**
- Show:
- **Existing Production Impact**
- None
- **Objects to Create**
- 34
- **Objects to Modify**
- 0
- **Objects to Delete**
- 0
- **For Modification**
- Example:
- **Create: 2**
Modify: 7
Deactivate: 1
Delete: 0
- **Before / After Comparison**
- When modifying:
- **Before**
- Adult Weekend Price: AED 120
- **After**
- Adult Weekend Price: AED 140
- **Warnings**
- Example:

Family Package was AI-recommended rather than explicitly requested.

Gate assignment remains pending.

AI Final Assessment

The proposed configuration is technically valid and all mandatory dependencies are resolved.

Two non-blocking recommendations remain. The configuration can proceed to governance and approval.

Actions

Modify with AI

Return to Builder

Save Draft

Primary CTA

Submit for Approval & Execution →

This moves the package to **Board 3**.

Critical AI Configuration Object Model

Soft Labs should implement a structured intermediate object between the AI conversation and TICVAI's actual modules.

I recommend calling it the:

- **Configuration Plan**
- The architecture becomes:
- **Natural Language**

- **Board 1 — Configuration Blueprint**

- **Board 2 — Configuration Plan**

- **Board 3 — Approved Execution**

TICVAI Modules

The Configuration Plan should contain objects such as:

- Object: Ticket Product
- Action: CREATE
- Name: Adult Admission
- Owner Module: Ticketing
- Source: User Requirement
- Dependencies:
 - Venue
 - Timeslot Template
 - Capacity Pool
 - Pricing Profile
 - Entitlement
- Status: VALID

This prevents the AI from directly manipulating TICVAI based purely on conversational text.

AI Must Use Existing Module Configuration

This is particularly important.

If AI determines:

“Create Dynamic Pricing”

it should not create a simplified AI-specific dynamic-pricing configuration.

It should prepare configuration against the **existing TICVAI Dynamic Pricing model**.

Likewise:

- **Ticket Product** → Ticketing Module
- **Pricing Profile** → Pricing Module
- **Promotion** → Promotion Module
- **Seat Map** → Seat Module
- **Dynamic QR** → Ticket Media
- **Access Rule** → Access Control
- **Payment** → Payment Module

- **Membership** → Membership Module

Therefore the AI Assistant becomes an **orchestration layer across TICVAI**, not another duplicate configuration platform.

Three Sources of Configuration

Every proposed value should have provenance.

User Provided

Example:

- Adult Price = AED 120
- **AI Recommended**
- Example:
- Family Package
- **System Derived**
- Example:
- 20 timeslots generated from 10:00–20:00 with 30-minute duration
- This should remain visible throughout Boards 2 and 3.

It will be extremely useful for auditability and user trust.

AI Validation Levels

I recommend four validation layers:

- **Level 1 — Field Validation**
- Is the value technically valid?
- Example:
- Capacity cannot be negative.
- **Level 2 — Object Validation**
- Is the object complete?
- Example:
- Ticket product requires validity and entitlement.
- **Level 3 — Cross-Module Validation**
- Do related modules agree?
- Example:
- Product schedule must fit operating calendar.
- **Level 4 — Business Logic Validation**
- Does the overall setup make sense?
- Example:
- Venue capacity = 150
- but:

VIP capacity = 50

General capacity = 150

If both consume the same venue simultaneously, AI should question whether total admission could become **200**.

This fourth layer is where the AI can provide significant value beyond ordinary configuration software.

What Board 2 Must NOT Do

Board 2 should **not**:

- • Publish products
 - • Activate pricing
 - • Modify production configuration
 - • Issue tickets
 - • Open sales
 - • Activate access rules
 - • Execute destructive changes
 - • Bypass approvals
 - Board 2 creates the **proposed configuration package**.
 - Board 3 governs actual execution.
-

Board 2 — Final Screen Map

AI Configuration Builder & Validation

1. **AI Configuration Build Command Center**
2. **Venue & Organization Configuration**
3. **Product Configuration Assistant**
4. **Schedule, Capacity & Availability Configuration**
5. **Pricing & Commercial Configuration**
6. **Promotion, Bundle & Upsell Configuration**
7. **Seating, Access & Operational Configuration**
8. **Channel, Media & Fulfillment Configuration**
9. **Cross-Module Conflict & Dependency Validation**
10. **Configuration Preview & Impact Analysis**

The experience across the first two boards is now very clear:

- **Board 1:**
 “Tell TICVAI what your business needs.”
 ↓
- **Board 2:**
 “TICVAI shows exactly how it proposes to configure the platform.”
 ↓
- **Board 3:**
 “Govern, approve, and safely execute those changes.”

That separation is important because it gives TICVAI the ease of conversational AI **without sacrificing the configuration controls required by an enterprise ticketing platform**.

AI Configuration Assistant — Board 3: AI Approval, Execution & Continuous Configuration

Board Purpose

Board 3 is the **governance and execution layer** of the AI Configuration Assistant.

Boards 1 and 2 have already established:

Board 1 — Understand

Business intent → guided discovery → Configuration Blueprint

Board 2 — Build & Validate

Blueprint → proposed TICVAI Configuration Plan → dependency validation → impact analysis

Board 3 — Govern & Execute

Configuration Plan → readiness → approval → controlled execution → verification → ongoing change management

The most important architectural principle is:

AI must never directly change production configuration simply because a user asked it to.

Every AI-generated change must pass through TICVAI's normal permission, approval, dependency, validation, audit, and lifecycle controls.

Board 3 therefore becomes the controlled bridge between:

- “AI recommends this configuration”
- and:

“This configuration now exists and is active in TICVAI.”

Screen 1 — AI Configuration Readiness Center

Purpose

Provide a final readiness assessment before the proposed Configuration Plan can enter approval or execution.

This is the first governance gate.

Header

Dubai Museum — Configuration Readiness

Plan:

- CFG-PLAN-000128
- Blueprint:
- v1.0
- Configuration Plan:
- v1.0
- Overall Readiness:

96% — Ready with Warnings

Header KPIs

- Configuration Objects
- Ready
- Warnings
- Blocking Issues
- Approval Requirements
- AI Recommendations
- Modules Affected
- Production Impact

Example:

- 34 Objects
- 32 Ready
- 2 Warnings
- 0 Blocking
- 3 Approvals
- 8 Modules
- Readiness by Area

Configuration Area	Objects	Validation	Dependencies	Approval	Status
Venue	1	Passed	Passed	Required	Ready
Products	3	Passed	Passed	Required	Ready
Schedule	24	Passed	Passed	—	Ready

Configuration Area	Objects	Validation	Dependencies	Approval	Status
Capacity	1	Passed	Passed	—	Ready
Pricing	3	Passed	Passed	Required	Ready
Channels	2	Passed	Passed	—	Ready
Media	1	Passed	Passed	—	Ready
Access	1	Passed	Passed	—	Ready

- **Readiness Categories**

- Support:

- • Ready
- • Ready with Warning
- • Approval Required
- • Missing Information
- • Conflict
- • Blocked

- **Blocking Rules**

- Example:

 Execution Blocked

Online sales channel enabled without payment configuration.

or:

- Pricing profile has no effective date.

- **Non-Blocking Warning**

- Example:

Gate assignment is not yet completed. Access policy can be created but cannot become operational until a gate is associated.

Actions

[Review Issues](#) | [Ask AI](#) | [Revalidate](#) | [Submit for Approval](#)

Screen 2 — Configuration Validation Results

Purpose

Provide detailed evidence that the proposed configuration has passed all required TICVAI validation layers.

Screen 1 provides the summary; Screen 2 provides the **technical and business evidence**.

Validation Summary

Total Checks: 126

✓ Passed: 119

⚠ Warning: 7

✗ Failed: 0

Validation Layers

Level 1 — Field Validation

Example:

- ✓ Currency valid
 - ✓ Capacity numeric
 - ✓ Effective dates valid

- **Level 2 — Object Validation**

- Example:
 - ✓ Ticket products complete
 - ✓ Pricing profiles complete
 - ✓ Access policy complete

- **Level 3 — Cross-Module Validation**

- Example:
 - ✓ Products linked to pricing
 - ✓ Products linked to capacity
 - ✓ Products linked to ticket media
 - ✓ Entitlements linked to access rules

Level 4 — Business Logic Validation

Example:

- ✓ Maximum admission does not exceed configured capacity.
- ⚠ Family product capacity consumption requires monitoring.

Validation Detail

Selecting a validation shows:

- **Validation**
 - Product Pricing Coverage

Affected Objects

Adult Admission
Child Admission
Family Admission

Rule

Every saleable product must have valid pricing for its enabled sales channels.

Result

Passed

Revalidation

If anything changes:

- **Configuration Changed**
- **Affected Checks Identified**
- **Revalidate**
- **Readiness Recalculated**

Actions

[Revalidate All](#) | [View Warning](#) | [Export Validation](#) | [Return to Builder](#)

Screen 3 — AI Recommendations & Best-Practice Review

Purpose

Separate **mandatory configuration** from AI recommendations so the administrator understands what TICVAI requires versus what AI merely suggests.

This is important for trust and governance.

Recommendation Categories

- Operational
- Commercial
- Customer Experience
- Capacity
- Pricing
- Access
- Risk
- Configuration Simplification
- Best Practice

Recommendation Card

Example:

- **Family Package**
- **AI Recommended**
- Reason:

Adult and Child admission products exist. A Family Package may improve conversion for family visitors.

Expected Configuration:

- 2 Adult Admissions
- 2 Child Admissions
- **Decision**
- **Accept**
- **Modify**
- **Reject**
- **Defer**
- **Another Example**
- **Capacity Warning Threshold**
- AI Recommendation:

Configure an 85% capacity warning so operations can monitor high-demand timeslots before reaching full capacity.

Recommendation Evidence

Where available:

- **Based On**

- • Current Configuration
- • TICVAI Business Rules
- • Venue Template
- • Existing Configuration Pattern

AI must not imply evidence from customer performance data unless such data actually exists.

Decision History

Track:

- **Recommendation**
- Family Package
- **Decision**
- Rejected
- **By**
- Administrator
- **Reason**
- Not part of launch phase.

Actions

Accept Selected | Reject | Defer | Ask AI Why

Screen 4 — Configuration Approval Workflow

Purpose

Route the proposed AI configuration through TICVAI's existing **RBAC/PBAC and approval governance** before execution.

The AI Assistant should **reuse the central TICVAI approval engine**, not create an independent approval system.

Approval Package

Configuration Plan

Dubai Museum Initial Setup

Requested By

Administrator

Generated With

TICVAI AI Configuration Assistant

Risk

Medium

Approval Requirements

TICVAI should determine approvals based on:

- • Object Type
- • Environment
- • Financial Impact
- • Operational Impact
- • Security Impact
- • User Permissions
- • Tenant Policy
- • Change Risk
- **Example Approval Chain**
- **Step 1**
- Business Configuration Owner
- ✓ Approved

- **Step 2**
- Commercial / Pricing Owner
- ● Pending

- **Step 3**
- Platform Administrator
- ○ Waiting
- **Parallel Approval**
- Where policy permits:
- **Operations**

and

- **Finance**
- may approve simultaneously.
- **Approval Detail**
- Show:
 - • Approver
 - • Role
 - • Status
 - • Submitted
 - • Decision Time
 - • Comments
 - • Conditions
- **Approver View**
- The approver should see:
- **What is being created?**
- **What is being modified?**
- **What is AI-recommended?**
- **What is the business impact?**
- **What are the risks?**
- **Decision Options**

- **Approve**
- **Approve with Conditions**
- **Reject**
- **Request Changes**
- **Approval Impact**
- If changes are requested:
- **Board 3**
- → Return to Board 2
- → Modify Configuration Plan
- → Revalidate
- → Resubmit affected approvals

Actions

Approve | Reject | Request Change | View Impact

Screen 5 — AI Configuration Execution Center

Purpose

Execute the approved Configuration Plan against the appropriate TICVAI modules in a controlled and traceable sequence.

This is where proposed configuration becomes **real TICVAI configuration**.

Header

Dubai Museum — Execution

Plan:

- CFG-PLAN-000128
- Environment:
- **Production**
- Approval:
- ✓ Complete
- Execution Status:
- **In Progress**
- **Execution Sequence**
- Example:
- **1. Organization Context**
- ✓ Verified
- **2. Venue**
- ✓ Created
- **3. Operating Calendar**
- ✓ Created
- **4. Ticket Products**
- ✓ 3 Created
- **5. Timeslots**
- ● Creating 24 Rules

- **6. Capacity**
- ○ Waiting
- **7. Pricing**
- ○ Waiting
- **8. Channels**
- ○ Waiting
- **9. Ticket Media**
- ○ Waiting
- **10. Access Rules**
- ○ Waiting
- **Progress**
- **42%**
- **Object Execution Detail**

Object	Module	Action	Dependency	Status
Dubai Museum	Venue	Create	Organization	Success
Adult Admission	Ticketing	Create	Venue	Success
Child Admission	Ticketing	Create	Venue	Success
Museum Capacity	Capacity	Create	Schedule	Waiting

- **Execution Controls**
- **Pause**

Resume

Cancel Remaining

Emergency stop where supported.

Important Rule

Execution should occur through controlled **TICVAI service/API interfaces**, not through direct database manipulation by the AI layer.

Screen 6 — Execution Progress & Dependency Monitor

Purpose

Provide a detailed real-time view of execution dependencies, failures, retries, and downstream configuration status.

Dependency Graph

Show:

- Venue ✓
- Operating Calendar ✓
- Products ✓

• Timeslots ✓

• Capacity ●

• Pricing ○

• Channels ○

• Media ○

• Access ○

• Status

• Each node:

- • Waiting
- • Executing
- • Success
- • Warning
- • Failed
- • Skipped
- • Rolled Back

• Failure Example

• Pricing Profile Creation Failed

• Object:

• Weekend Adult Pricing

• Reason:

Effective-date conflict with an existing pricing profile.

Dependency Impact

Blocked:

- • Adult B2C Association
- • Adult POS Association
- Unaffected:
 - • Venue
 - • Products
 - • Schedule
 - • Capacity

AI Resolution Recommendation

“An active Adult pricing profile already covers this period. I recommend modifying the proposed effective date rather than replacing the existing profile.”

Recovery Actions

Retry

Modify & Retry

Skip if Allowed

Pause Execution

Initiate Rollback

Retry History

Attempt 1 — Failed

Attempt 2 — Failed

Resolution Applied

Attempt 3 — Success

Rule

AI must never repeatedly retry configuration indefinitely.

Retry limits and recovery behavior must be controlled.

Screen 7 — Configuration Results & Object Mapping

Purpose

Show exactly what TICVAI objects were created or changed after successful execution.

Execution Summary

Configuration Completed Successfully

Created: 34

Modified: 0

Failed: 0

Skipped: 0

Object Mapping

Blueprint Requirement	TICVAI Object	Module	Object ID	Status
Dubai Museum	Venue	Venue	VEN-1028	Active
Adult Admission	Ticket Product	Ticketing	TKT-4012	Draft
Child Admission	Ticket Product	Ticketing	TKT-4013	Draft
Museum Capacity	Capacity Pool	Capacity	CAP-0218	Active
Standard Pricing	Pricing Profile	Pricing	PRC-3002	Draft

Important Lifecycle Distinction

Created does not necessarily mean:

- **Published / On Sale**
- For example:
- Ticket Product:
- **Created** ✓
- Publication:

Pending

This must follow the lifecycle rules of the owning module.

Relationship Map

Show:

- **VEN-1028**

- **TKT-4012**

- **SCH-0291**

- **CAP-0218**

- **PRC-3002**

- **MED-0082**

- **ACC-0142**

Actions

[Open Object](#) | [View Module](#) | [View Execution Log](#) | [Continue to Publication](#)

Publication remains governed by the owning modules and their workflows.

Screen 8 — Configuration Change & Modification Assistant

Purpose

Allow administrators to return later and modify existing TICVAI configuration through natural-language AI.

This is what transforms the feature from an **onboarding wizard** into a permanent AI configuration capability.

AI Input

What would you like to change?

Examples:

- “Increase weekend Adult tickets to AED 150.”
- “Add VIP admission.”
- “Close the museum at 6 PM during Ramadan.”
- “Allow re-entry for annual members.”
- “Add B2B reseller sales.”

• Example Conversation

- Administrator:

Increase weekend Adult tickets from AED 140 to AED 150 starting next month.

AI:

I found the Weekend Adult Pricing Profile. The change would affect B2C and POS sales from 1 October onward. Existing issued tickets will not be repriced.

Would you like me to prepare the change?

AI Identifies

Object

Adult Weekend Pricing

Current

AED 140

Proposed

AED 150

Effective

01 October

Execution

This reuses the same architecture as Boards 1–3.

Actions

[Prepare Change](#) | [Ask More](#) | [Cancel](#)

Screen 9 — Configuration History, Versions & Rollback

Purpose

Maintain complete version history for AI-created and AI-modified configuration and provide governed rollback capability where technically possible.

Configuration Timeline

Example:

- **Version 1.0**
- **Initial Museum Setup**
- 12 Sep 2026
- 34 Objects Created
- **Version 1.1**

- **Weekend Pricing Change**

- 01 Oct 2026
- 3 Objects Modified

- **Version 1.2**

- **VIP Product Added**

- 15 Oct 2026
- 8 Objects Created

- **Version Comparison**

- Select:

- **v1.1**

vs.

- **v1.2**

- Show:

- **Created**

- VIP Admission

- **Modified**

- Capacity Allocation

- **Modified**

- Access Rule

- **Before / After**

- Example:

- **Adult Weekend Price**

- v1.0:

- AED 140

- v1.1:

- AED 150

- **Rollback**

- Allow:

- **Rollback Selected Change**

- not necessarily:

Rollback Entire Venue

because configuration may have downstream transactions.

Rollback Safety Analysis

Before rollback:

- **Impact Analysis**

- Affected objects: 3
- Issued tickets: 2,420
- Future orders: 186
- Pricing transactions already completed: 1,203

- **Rollback Result**

- TICVAI may determine:

-  **Full rollback is unsafe.**

- AI recommendation:

“Create a new effective-dated pricing change instead.”

Actions

[Compare](#) | [View Version](#) | [Assess Rollback](#) | [Restore Where Safe](#)

Screen 10 — AI Configuration Audit & Governance

Purpose

Provide an immutable governance record showing how AI participated in every configuration decision and execution.

This is essential for an enterprise AI system.

Header KPIs

- AI Configuration Sessions
- AI Recommendations
- Accepted
- Rejected
- Executed Changes
- Rollbacks
- Approval Overrides
- Failed Executions

Audit Search

Filter by:

- • Tenant
- • Venue
- • User
- • Date
- • Session

Critical Execution Architecture

I recommend we make this requirement explicit to Soft Labs.

The architecture should be:

Owning TICVAI Modules

The AI should **not have unrestricted write access to TICVAI databases**.

That distinction is extremely important.

Execution Dependency Engine

Execution cannot simply send 34 configuration commands simultaneously.

The system must understand dependency order.

For our museum example:

- 1. Organization Context

- 2. Venue

- 3. Operating Calendar

- 4. Ticket Products

- 5. Schedule / Timeslots

- 6. Capacity

- 7. Pricing

- 8. Channels

- 9. Ticket Media

- 10. Access Rules

If **Venue Creation fails**, downstream objects depending on that venue should not execute.

This should be represented as a **dependency DAG (Directed Acyclic Graph)** internally.

Transaction & Compensation Strategy

Because TICVAI configuration spans multiple modules, Soft Labs should not assume everything can be handled through one database transaction.

Example:

- AI successfully creates:
 - ✓ Venue
 - ✓ Products
 - ✓ Schedule
 - ✓ Capacity
- but:
- ● Pricing fails.
- TICVAI needs to know whether to:

A. Pause and Resume

Keep successful configuration and resolve Pricing.

B. Compensate

Undo previously created objects where safe.

C. Complete Partially

Only if governance explicitly allows it.

Therefore each execution step should define:

- • Action
 - • Dependency
 - **Success Criteria**
 - Failure Behavior
 - Retry Policy
 - Compensation Action
 - Rollback Capability
-

Risk-Based Approval

Not every AI configuration change should require the same approval.

For example:

- **Low Risk**
 - Rename internal configuration description.
 - Potentially execute immediately if user has permission.
- **Medium Risk**
 - Add a new ticket product.
 - May require Product Owner approval.
- **High Risk**
 - Change pricing.
 - Requires Commercial approval.

Critical

Modify access security rules across all gates.

Requires elevated approval.

Therefore:

- **AI Request**
 - → **Impact + Risk Score**
 - → **PBAC/RBAC Policy**
 - → **Required Approval**

This will keep the AI experience fast without weakening TICVAI governance.

AI Autonomy Levels

I recommend TICVAI support configurable AI autonomy levels.

Level 0 — Advisory

AI only recommends.

Level 1 — Prepare

AI can build Configuration Plans but cannot execute.

Level 2 — Execute with Approval

AI can execute after required approval.

Level 3 — Auto-Execute Low-Risk Changes

AI can automatically execute specifically approved low-risk change categories.

Higher-risk changes still require approval.

This should be configurable per:

- • Tenant
 - • User Role
 - • Module
 - • Configuration Type
 - • Environment
 - • Risk Level
 - I would **not** recommend unrestricted AI autonomy.
-

Human Override

Administrators must always be able to:

- **Pause AI**
- **Reject Recommendation**
- **Modify Proposal**
- **Request Explanation**
- **Cancel Pending Execution**
- **Take Manual Control**

Escalate for Approval

The AI is an orchestration and intelligence layer, not the ultimate authority.

Continuous Configuration Loop

Board 3 completes the initial configuration, but it also creates the long-term operating model:

- **Ask AI for Change**
- ↓
- **AI Understands Existing Configuration**
- ↓
- **Proposes Modification**
- ↓
- **Shows Impact**
- ↓
- **Validates Dependencies**
- ↓
- **Gets Approval**

- Executes

- Verifies

- Adds Configuration Version

Audit

So six months after launch, the administrator can still say:

“Create a summer evening ticket available only Thursday to Saturday from 6 PM to 10 PM, priced at AED 90, sold on B2C and POS, with single-entry QR access.”

TICVAI should be able to take that request through the same governed configuration pipeline.

Board 3 — Final Screen Map

AI Approval, Execution & Continuous Configuration

1. AI Configuration Readiness Center
2. Configuration Validation Results
3. AI Recommendations & Best-Practice Review
4. Configuration Approval Workflow
5. AI Configuration Execution Center
6. Execution Progress & Dependency Monitor
7. Configuration Results & Object Mapping
8. Configuration Change & Modification Assistant
9. Configuration History, Versions & Rollback

10. AI Configuration Audit & Governance

With this board, the **AI Configuration Assistant is complete at 3 Boards / 30 Screens.**

The complete architecture is now:

Board 1 — AI Guided Discovery & Configuration Blueprint

Understand what the customer wants.

Board 2 — AI Configuration Builder & Validation

Determine exactly how TICVAI should be configured.

Board 3 — AI Approval, Execution & Continuous Configuration

Safely approve, execute, verify, modify, version, and audit the configuration.

This gives TICVAI something substantially more powerful than an AI chatbot: it becomes a **governed AI configuration orchestration layer across the entire TICVAI platform.**
